APPENDIX H:
PUBLIC SERVICES DATA

FIRE PROTECTION SERVICES

October 20, 2015

Harold Schapelhouman, Fire Chief
Menlo Park Fire Protection District
170 Middlefield Road
Menlo Park, CA 94025

Re: Fire Protection Services

Dear Chief Schapelhouman:

The City of Menlo Park is currently updating the Land Use and Circulation Elements of the General Plan, which were last comprehensively updated in 1994. In addition, the City is updating the Bayfront Area Zoning ordinance. Collectively, the updates are referred to as ConnectMenlo. Both the General Plan Update and the Zoning Ordinance Update are summarized below, followed by Table 1, which is the existing and proposed 2040 Horizon-Year Buildout Projections. As shown in the table, the projected growth for the proposed ConnectMenlo Project for the 2040 horizon year, plus the Current General Plan development potential (but not including Facebook Campus Expansion), is 4.1 million square feet of non-residential space, 400 hotel rooms and 5,500 residential units, and up to 14,150 new residents and 9,900 employees.

General Plan Update

The proposed Land Use and Circulation Elements are intended to guide development and conservation in the city through the 2040 buildout horizon of this General Plan. These two elements are central components of the General Plan because they describe which land uses should be allowed in the city, where those land uses should be located, how those land uses may be accessed and connected, and how development of those uses should be managed so as to minimize impacts and maximize benefits to the city and its residents. The Land Use Element frames the type and scale of potential development that may occur over the next 24 years, particularly in the Bayfront Area. The Circulation Element addresses transportation issues throughout the city. Both updated Elements have been written to be consistent with the other General Plan Elements and the 2012 El Camino Real/Downtown Specific Plan.

Bayfront Area Zoning Ordinance Update

The Project includes an update to the City's Zoning Ordinance for the Bayfront Area formerly referred to as the "M-2 General Industrial Zoning District", including both development regulations and design standards, to ensure consistency with the General Plan Update and previously adopted ordinances and policies. The proposed Zoning Ordinance Update would create the following five new districts, which would apply to lands within the Bayfront Area: Light Industrial (I-L), Business Park (C-BP), Office/Tech/Research and Development (O), Life Sciences (LS), and Mixed Use Residential (R-MU). These districts are intended to foster innovation and emerging technologies; promote the creation of an employment district with travel patterns that are oriented toward pedestrian, transit, and bicycle use; and provide amenities to surrounding neighborhoods and fiscal support to the City leveraged through development intensity bonuses. The standards for development within the LS and O districts allow increased development intensities with the provision of community amenities.

TABLE 1 EXISTING AND PROPOSED 2040 HORIZON-YEAR BUILDOUT PROJECTIONS

Notes: *Numbers are estimates and rounded for the purposes of this programmatic environmental review.*

a. Includes existing development on the ground.

b. Includes reasonably foreseeable projects (i.e. pending applications, recently approved, or under construction) in the Study Area; including the current Facebook Campus Expansion Project shown in a separate column. A list of approved projects is shown in Chapter 4, Environmental Evaluation, of this Draft EIR.

d. This represents what could be built if the proposed ConnectMenlo project were not approved, which is the "No Project" condition discussed in Chapter 5, Alternatives to the Proposed Project, of this Draft EIR.

e. The Proposed Bayfront Area development potential represents increased development potential for the Bayfront Area only, but does not include the Facebook Campus Expansion Project, which is shown in a separate column.

f. The Maximum Citywide Buildout represents the total of the 5 previous columns.

g. Potential Commercial square footage in the Bayfront Area would occur within Office and Residential districts.

h. An unknown number of additional hotel rooms could be proposed under the current General Plan; Hotel square footage is not included in the Facebook Campus Expansion Project and Proposed Bayfront Area development potential non-residential square feet.

i. Assumes 2.57 persons per household per Association of Bay Area Governments (ABAG) *Projections 2013, Subregional Study Area Table*.

As part of the environmental review process required by the California Environmental Quality Act (CEQA) a determination must be made as to whether the project would not be adequately served by existing police protection service facilities thus requiring the construction of new facility or improvements to an existing facility that would result in a physical impact to the environment. We've received letters dated March 31, 2015 and June 16, 2015 to the City Council regarding the potential impacts to Station 77 as a result of the Project and appreciate and value the input that the Fire Protection District has provided thus far.

Below is an excerpt from Existing Conditions Reports that were released for public review in January 2015, followed by several questions. Please confirm the information in the excerpt and update as needed, and address the questions. Because the information included in the Existing Conditions Reports was gathered in the previous fiscal year, information regarding number of staff, operating budget, equipment, may no longer reflect current existing conditions. Your input in confirming and/or updating the information below will help us to complete our environmental review and to make a determination of whether or not a significant environmental impact could occur as a result of the adoption of the proposed Project, pursuant to State CEQA Guidelines.

The General Plan Update and Zoning Ordinance Update that are the subject of this EIR consist of long-term plans that will be implemented as policy documents guiding future development activities and City actions through the year 2040. Because this is a program-level EIR, this document does not evaluate the impacts of specific, individual developments that may be allowed under the General Plan. Future specific projects may require separate environmental review.

To determine whether the proposed project would have the potential to have a significant environmental effect related to **fire protection services**, the Draft Environmental Impact Report (Draft EIR) being prepared for the proposed project applies the following standard of significance:

> *Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for fire protection services?*

The purpose of the Draft EIR is to assess the project's potential impacts to various environmental issue areas and public service and utility agencies, including the City of Menlo Park's public safety, provided by the Menlo Park Fire Protection District. The Draft EIR will also provide recommendations that may be necessary to reduce such potential impacts to "less-than-significant" levels.

Below are excerpts from the 2015 Existing Conditions Report for the Project. Please confirm the information regarding staffing and response times, and any assistance that you can provide with the questions that follow would be greatly appreciated:

Menlo Park Fire Protection District Operations

Dispatching for the MPFPD is conducted through the Countywide consolidated Fire Dispatch Center. MPFPD personnel respond to more than 8,000 calls for service annually, of which 61 percent are medical emergencies. The Menlo Park Fire Protection District operates seven stations at the following locations:

- Station 1: 300 Middlefield Rd. (1250 plus calls for service per year)
- Station 2: 2290 University Ave. (East Palo Alto – 2000 plus calls for service per year)
- Station 3: 32 Almendral (Atherton – 800 plus calls for service per year)
- Station 4: 3322 Alameda de Las Pulgas (unincorporated County – 1100 plus calls for service per year)
- Station 5: 4101 Fair Oaks Avenue (unincorporated county – 700 plus calls for service per year)
- Station 6: 700 Oak Grove Avenue – (1200 plus calls for service per year)
- Station 77: 1467 Chilco Avenue – (700 plus calls for service per year)

The Fire District maintains the following equipment and vehicle fleet:[1]

- One battalion SUV command vehicle (operating out of Station 1)
- One reserve battalion SUV command vehicle
- Seven Type 1 heavy fire engines (one at each station)
- Three Type 1 heavy reserve fire engines
- One ladder truck (105-foot ladder, operating out of Station 1)
- One reserve ladder truck (100-foot aerial ladder)
- One medium-duty technical rescue vehicle
- One utility truck with skid mount pump
- Three inflatable rescue boats and trailer
- Two jet skis and trailer
- One Office of Emergency Services (OES) water rescue truck
- One airboat and trailer
- Four fire prevention/investigation vehicles
- Two fire mechanic field utility trucks
- One dually crew cab truck (used to tow trailers)

Each of the seven fire stations is equipped with one Type 1 heavy fire engine and is continuously staffed by three fire crew members: a captain, an apparatus driver, and a paramedic. Every station operates on three rotating 48-hour shifts to ensure 24-hour constant service. Fire District staff also includes two full-time mechanics who maintain District response vehicles. Administrative offices for the Menlo Park Fire Protection District are located at 170

[1] Menlo Park Fire Protection District (MPFPD). http://www.menlofire.org, accessed October 23, 2014. 20 Menlo Park Fire Protection District, Fiscal Year 2014–2015 Adopted District Budget & CA-TF2 US&R Budget, http://www.menlofire.org/pdf/
budget1415/Budget%2014-15.pdf, accessed October 23, 2014. Edited, updated, and confirmed by the MPFPD, December 2014.

Middlefield Road, near the Willow Road intersection. For fiscal year 2014–2015, MPFPD's staffing level was anticipated to be 115.5 full-time equivalents.[2]

The MPFPD provides in-department training in the following areas: emergency medical technician/paramedic response; technical rescue; auto extrication; live fire training; ropes operations; incident simulation and career development; hazardous materials first response, situational awareness, command and control; and incident command special training in Urban Search and Rescue (USAR) consisting of collapsed structure, trench and confined space training. To maintain these training programs, the MPFPD training unit engages in annual requirements for all specialties including driver operator and acting officer testing, as well as probationary testing, and mandates requirements for yearly training, which consists of on-line computer and hands-on training formats. Additionally, the MPFPD runs a variety of community training and education programs, including community emergency preparedness consisting of agency to agency or inter-governmental service agreements to meet mandated training, plans and exercise requirements for unified command, Community Emergency Response Team (CERT) training, Get Ready, and the Boy Scouts high school explorer and College of San Mateo fire cadet work experience programs, which teach and train young people and students about careers in the Fire Service. MPFPD also provides custom-designed school and workplace fire safety education programs for the public by request.[3]

Fire District Budget

The 2014/2015 total budget for the Menlo Park Fire Protection District is $37.7 million, which represents a 3 percent decrease from the 2013/2014 budget, primarily due to decreased capital expenditures. The MPFPD receives the majority of its funding through property taxes and operational/developmental permitting fees, with smaller amounts coming from intergovernmental transfers, such as grants or funding provided by other agencies. The 2014/2015 budget for MPFPD includes $5.8 million for the completion of construction on Station 2 and $6.7 million for the redevelopment of Station 6.

The MPFPD maintains a schedule of fees for a variety of uses and permits in order to help support cost recovery for the District. These fees were adopted in 2012 subsequent to a fee study that was completed earlier that year. In early 2014, Facebook partnered with the Menlo Park Fire Protection District to provide $150,000 for the installation of traffic signal preemption devices that would give emergency vehicles priority at key intersections along Marsh Road, Bayfront Expressway, Willow Road, and University Avenue.[4]

1. Would the Menlo Park Fire Protection District need to construct new facilities or expand existing facilities in order to accommodate the project's demand for fire protection services?

2. Is the information in the above text accurate? If not, please provide updated information as needed.

3. How many emergency medical incident calls does the department respond to per year? What is the response goal for an emergency medical incident?

---

[2] Menlo Park Fire Protection District (MPFPD). http://www.menlofire.org, accessed October 23, 2014. 20 Menlo Park Fire Protection District, Fiscal Year 2014–2015 Adopted District Budget & CA-TF2 US&R Budget, http://www.menlofire.org/pdf/budget1415/Budget%2014-15.pdf, accessed October 23, 2014. Edited, updated, and confirmed by the MPFPD, December 2014.

[3] Communication with Menlo Park Fire Protection District (MPFPD) by City of Menlo Park, November 2014.

[4] Communication with Menlo Park Fire Protection District (MPFPD) by City of Menlo Park, November 2014.

4. Are there any existing deficiencies, such as lack of staffing and/or facilities and equipment?

5. Are there any existing plans for expansion or relocation of stations that would serve the project? If so, please describe the expansion or relocation.

6. Would the project require the Fire Protection District to hire more firefighters or staff?

7. What is the status of the department's Fire Protection Facilities Impact Fee Program? Has it been adopted and is it currently being levied on new residential and non-residential development in the department's boundaries? Does your department recommend other standard criteria for assessing the significance of a proposed project's impacts in an EIR or other environmental impact documentation? If so, what are those criteria?

8. Please provide recommendations that could reduce the demand for fire protection services created by the proposed project.

9. Please provide any current documents on fire protection service in the City including background reports, number of incidents, policy documents, and facility plans that you think would help with preparing the environmental review analysis for impacts to police services as a result of the proposed project.

10. In addition to concerns in the letters received by the City Council dated March 31, 2015 and June 16, 2015 regarding potential impacts to Station 77, are there any other concerns regarding potential impacts to the Fire Protection District as a result of the Project? If so, please describe.

If you have any questions, please feel free to contact me at 510.848.3815.

Sincerely,

Ricky Caperton

PLACEWORKS

October 20. 2015

Harold Schapelhouman, Fire Chief
Menlo Park Fire Protection District
170 Middlefield Road
Menlo Park, CA 94025

Re: Fire Protection Services

Dear Chief Schapelhouman:

The City of Menlo Park is currently updating the Land Use and Circulation Elements of the General Plan, which were last comprehensively updated in 1994. In addition, the City is updating the Bayfront Area Zoning ordinance. Collectively, the updates are referred to as ConnectMenlo. Both the General Plan Update and the Zoning Ordinance Update are summarized below, followed by Table 1, which is the existing and proposed 2040 Horizon-Year Buildout Projections. As shown in the table, the projected growth for the proposed ConnectMenlo Project for the 2040 horizon year, plus the Current General Plan development potential (but not including Facebook Campus Expansion), is 4.1 million square feet of non-residential space, 400 hotel rooms and 5,500 residential units, and up to 14,150 new residents and 9,900 employees. Menlo Fire Comment - We believe the Facebook Expansion Project should be included in the cumulative impacts analysis in the General Plan EIR.

General Plan Update

The proposed Land Use and Circulation Elements are intended to guide development and conservation in the city through the 2040 buildout horizon of this General Plan. These two elements are central components of the General Plan because they describe which land uses should be allowed in the city, where those land uses should be located, how those land uses may be accessed and connected, and how development of those uses should be managed so as to minimize impacts and maximize benefits to the city and its residents. The Land Use Element frames the type and scale of potential development that may occur over the next 24 years, particularly in the Bayfront Area. The Circulation Element addresses transportation issues throughout the city. Both updated Elements have been written to be consistent with the other General Plan Elements and the 2012 El Camino Real/Downtown Specific Plan.

Bayfront Area Zoning Ordinance Update

The Project includes an update to the City's Zoning Ordinance for the Bayfront Area formerly referred to as the "M-2 General Industrial Zoning District", including both development regulations and design standards, to ensure consistency with the General Plan Update and previously adopted ordinances and policies. The proposed Zoning Ordinance Update would create the following five new districts, which would apply to lands within the Bayfront Area: Light Industrial (I-L), Business Park (C-BP), Office/Tech/Research and Development (O), Life Sciences (LS), and Mixed Use Residential (R-MU). These districts are intended to foster innovation and emerging technologies; promote the creation of an employment district with travel patterns that are oriented toward pedestrian, transit, and bicycle use; and provide amenities to surrounding neighborhoods and fiscal support to the City leveraged through development intensity bonuses. The standards for development within the LS and O districts allow increased development intensities with the provision of community amenities.

TABLE 1 EXISTING AND PROPOSED 2040 HORIZON-YEAR BUILDOUT PROJECTIONS

Category	Existing Conditions[a]	+	"Approved" Projects[b]	+	Current General Plan[c]	+	Proposed Project (Bayfront Area)[d]	=	Maximum Citywide 2040 Buildout[e]

Notes: *Numbers are estimates and rounded for the purposes of this programmatic environmental review.*

a. Includes existing development on the ground.

b. Includes reasonably foreseeable projects (i.e. pending applications, recently approved, or under construction) in the Study Area; including the current Facebook Campus Expansion Project shown in a separate column. A list of approved projects is shown in Chapter 4, Environmental Evaluation, of this Draft EIR.

d. This represents what could be built if the proposed ConnectMenlo project were not approved, which is the "No Project" condition discussed in Chapter 5, Alternatives to the Proposed Project, of this Draft EIR.

e. The Proposed Bayfront Area development potential represents increased development potential for the Bayfront Area only, but does not include the Facebook Campus Expansion Project, which is shown in a separate column.

f. The Maximum Citywide Buildout represents the total of the 5 previous columns.

g. Potential Commercial square footage in the Bayfront Area would occur within Office and Residential districts.

h. An unknown number of additional hotel rooms could be proposed under the current General Plan; Hotel square footage is not included in the Facebook Campus Expansion Project and Proposed Bayfront Area development potential non-residential square feet.

i. Assumes 2.57 persons per household per Association of Bay Area Governments (ABAG) *Projections 2013, Sub regional Study Area Table*.

As part of the environmental review process required by the California Environmental Quality Act (CEQA) a determination must be made as to whether the project would not be adequately served by existing police protection service facilities due to not maintaining acceptable service ratios, response times or other performance objectives thus requiring the construction of new facility or improvements to an existing facility that would result in a physical impact to the environment. We've received letters dated March 31, 2015 and June 16, 2015 to the City Council regarding the potential impacts to Station 77 as a result of the Project and appreciate and value the input that the Fire Protection District has provided thus far.

PLEASE ALSO REVIEW AND CONSIDER INFORMATION IN FIRE DISTRICT LETTER ON NOP DATED JULY 20, 2015, A COPY OF WHICH IS ATTACHED.

Below is an excerpt from Existing Conditions Reports that were released for public review in January 2015, followed by several questions. Please confirm the information in the excerpt and update as needed, and address the questions. Because the information included in the Existing Conditions Reports was gathered in the previous fiscal year, information regarding number of staff, operating budget, equipment, may no longer reflect current existing conditions. Your input in confirming and/or updating the information below will help us to complete our environmental review and to make a determination of whether or not a significant environmental impact could occur as a result of the adoption of the proposed Project, pursuant to State CEQA Guidelines.

The General Plan Update and Zoning Ordinance Update that are the subject of this EIR consist of long-term plans that will be implemented as policy documents guiding future development activities and City actions through the year 2040. Because this is a program-level EIR, this document does not evaluate the impacts of specific, individual developments that may be allowed under the General Plan. Future specific projects may require separate environmental review.

To determine whether the proposed project would have the potential to have a significant environmental effect related to fire protection services, the Draft Environmental Impact Report (Draft EIR) being prepared for the proposed project applies the following standard of significance:

> *Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for fire protection services?*

The purpose of the Draft EIR is to assess the project's potential impacts to various environmental issue areas and public service and utility agencies, including the City of Menlo Park's public safety, provided by the Menlo Park Fire Protection District. THE EIR SHOULD CONSIDER IMPACTS OF TRAFFIC CONGESTION ON RESPONSE TIME AND EMERGENCY SERVICE ROUTES. IMPACTS DUE TO INCREASED BUILDING HEIGHT AND NEW RESIDENTIAL USES IN M-2 SHOULD BE ANALYZED. The Draft EIR will also provide recommendations that may be necessary to reduce such potential impacts to "less-than-significant" levels.

Below are excerpts from the 2015 Existing Conditions Report for the Project. Please confirm the information regarding staffing and response times, and any assistance that you can provide with the questions that follow would be greatly appreciated:

Menlo Park Fire Protection District Operations

Dispatching for the MPFPD is conducted through the Countywide consolidated Fire Dispatch Center. MPFPD personnel respond to more than 8,200 calls for service annually, of which 63 percent are medical emergencies.

The Fire District maintains the following equipment and vehicle fleet:

- One battalion SUV command vehicle (operating out of Station 1)
- One reserve battalion SUV command vehicle
- Seven Type 1 heavy fire engines (one at each station)
- Three Type 1 heavy reserve fire engines
- One ladder truck (105-foot ladder, operating out of Station 1)
- One reserve ladder truck (100-foot aerial ladder)
- One medium-duty technical rescue vehicle
- One utility truck with skid mount pump
- Three inflatable rescue boats and trailer
- Two jet skis and trailer
- One Office of Emergency Services (OES) water rescue truck
- One airboat and trailer
- Four fire prevention/investigation vehicles
- Two fire mechanic field utility trucks
- One dually crew cab truck (used to tow trailers)

Each of the seven fire stations is equipped with one Type 1 heavy fire engine and is continuously staffed by three fire crew members: a captain, an apparatus driver, and a paramedic. Every station operates on three rotating 48-hour shifts to ensure 24-hour constant service. Fire District staff also includes two full-time mechanics who maintain District response vehicles. Administrative offices for the Menlo Park Fire Protection District are located at 170 Middlefield Road, near the Willow Road intersection. For fiscal year 2015–20156 MPFPD's staffing level was anticipated to be 113.80 full-time equivalents.

The MPFPD provides in-department training in the following areas: emergency medical technician/paramedic response; technical rescue; auto extrication; live fire training; ropes operations; incident simulation and career development; hazardous materials first response, situational awareness, command and control; and incident command special training in Urban Search and Rescue (USAR) consisting of collapsed structure, trench and confined space training. To maintain these training programs, the MPFPD training unit engages in annual requirements for all specialties including driver operator and acting officer testing, as well as probationary testing, and mandates requirements for yearly training, which consists of on-line computer and hands-on training formats. Additionally, the MPFPD runs a variety of community training and education programs, including community emergency preparedness consisting of agency to agency or inter-governmental service agreements to meet mandated training, plans and exercise requirements for unified command, Community Emergency Response Team (CERT) training, Get Ready, and the Boy Scouts high school explorer and College of San Mateo fire cadet work experience programs, which teach and train young people and students about careers in the Fire Service. MPFPD also provides custom-designed school and workplace fire safety education programs for the public by request.

Fire District Budget

The 2015-16 adopted total budget is $37.5 million, which is a 22 percent decrease from the FY 2014-15 adjusted budget. The decrease is due to two major events:

- ☑ In FY 2014-15, the unfunded actuarial accrued liability for the Safety group retirement benefit was paid down by $12 million.
- ☑ The Capital Improvement Project funds budget decreased significantly due to the near completion of Station #2 construction.

For the FY 2015-16 adopted budget, $3.5 million is budgeted for the construction and improvement of stations. Specifically, $1.5 million is budgeted to complete Station No. 2 construction and $1.6 million to start Station No. 6 construction. As of June 30, 2015, the Fire District has set aside $21.8 million for the construction and replacement of stations, including $6.9 million for the construction of Station 6. However, as of June 30, 2015, the projected unfunded amount for capital improvement projects is $29 million.

The MPFPD maintains a schedule of fees for a variety of uses and permits in order to help support cost recovery for the District. The District also forms partnership with local businesses to improve public safety. For example, the District partnered with Facebook, Inc. to fund traffic preemptions and thermal imaging equipment. Facebook conducted a major redevelopment of its property and the Fire District is in the process of working closely with the company on the construction of its West campus, which consists of about 1,000,000 square feet on the old Tyco electronics property. With a growing number of employees and a growing campus, Facebook has helped the local economy tremendously. However, the Fire District's challenges have grown along with the business expansion.

1. Would the Menlo Park Fire Protection District need to construct new facilities or expand existing facilities in order to accommodate the project's demand for fire protection services?

   The Fire District will need to significantly remodel or rebuild Fire Station 77 to accommodate this level of growth and expansion.

2. Is the information in the above text accurate? If not, please provide updated information as needed.

   We have modified and updated the text.

3. How many emergency medical incident calls does the department respond to per year? What is the response goal for an emergency medical incident?

   The Fire District currently responds to over 8200 emergency incidents per year of which roughly 63% are for emergency medical incidents. See Standards of Cover Assessment Report for current information on response times. Our response time standard, under Board Resolution 1818, is to be on-scene of any incident within 7 minutes 90% of the time.

   7 Minutes includes 1 minute for dispatch, up to 2 minutes for turnout time and 4 minutes

for response or drive time. Per Fire Board Resolution 1818

4. Are there any existing deficiencies, such as lack of staffing and/or facilities and equipment?

The updated Standards of Cover Assessment report has identified that the existing fire stations, staffing and unit deployment are adequate for existing development and service population but are being strained by traffic congestion and by growth, specifically on the Eastern side of the District, or the Belle Haven, M2 area.

The report identifies that additional apparatus and personnel will be needed based upon growth and increased congestion. The Report states that: "Traffic congestion is also an increasing problem as the communities the District protects continue to evolve. The District's growing employment base and regional post-recession economic jobs recovery is yielding intense traffic congestion at rush hours. The GIS travel time analysis in this study and the prior incident travel time data for District responses clearly show the substantial hindrance this causes to emergency response travel in the District.

The only way going forward to maintain reasonable travel times will be for the District to add more crews, positioned initially east of Highway 101. Other crews may be needed later in the central and western District on a full- or part-time basis. One way to visualize this would be the tight fire station spacing needed in downtown urban areas like San Francisco, Manhattan, and Chicago, where traffic congestion impairs typical fire station spacing."

5. Are there any existing plans for expansion or relocation of stations that would serve the project? If so, please describe the expansion or relocation.

All Fire District stations serve this project area.

The Menlo Park Fire Protection District operates seven stations at the following locations

- Station 1: 300 Middlefield Rd. (1250 plus calls for service per year) – Needs to be rebuilt, constructed in 1955
- Station 2: 2290 University Ave. (East Palo Alto – 2000 plus calls for service per year) – Under construction – Completion 2016
- Station 3: 32 Almendral (Atherton – 800 plus calls for service per year) – Adequate – Built 1997
- Station 4: 3322 Alameda de Las Pulgas (unincorporated County – 1100 plus calls for service per year) – Needs to be rebuilt – Constructed in 1949
- Station 5: 4101 Fair Oaks Avenue (unincorporated county – 700 plus calls for service per year) – Adequate – Built 1997

- Station 6: 700 Oak Grove Avenue – (1200 plus calls for service per year) – Breaks ground in 2016 – Constructed in 1953
- Station 77: 1467 Chilco Avenue – (700 plus calls for service per year) – Will need to be rebuilt/remodeled – Built 1996

The Fire District has offered to purchase the land for Station 77 from the City or extend the lease agreement.

6. Would the project require the Fire Protection District to hire more firefighters or staff?

The Fire District would need to hire more personnel and raise the minimum daily staffing levels to be able to support this level of growth and expansion in order to maintain existing service levels based on fire safety personnel per 1,000 service population. MPFPD's current ratio of .86 firefighters per 1000 service population may need to be increased to at least 1 per 1000, which is in line with other similar communities

7. What is the status of the department's Fire Protection Facilities Impact Fee Program? Has it been adopted and is it currently being levied on new residential and non-residential development in the department's boundaries? Does your department recommend other standard criteria for assessing the significance of a proposed project's impacts in an EIR or other environmental impact documentation? If so, what are those criteria?

The Nexus Impact Fee study is complete and has been presented to the Fire Board for review. Staff is currently making modifications to a formal response back to the Board that includes local jurisdiction and developer comments and feedback.

Board adopted response time standards should be used as standard of significance in EIR.

Standard of significance should include maintaining current ratio for District fire safety personnel positions per 1,000 residents and 1,000 service population. MPFPD's current ratio of .86 firefighters per 1000 service population may need to be increased to at least 1 per 1000, which is in line with other similar communities.

8. Please provide recommendations that could reduce the demand for fire protection services created by the proposed project.

Increased fire prevention design and risk management services.

9. Please provide any current documents on fire protection service in the City including background reports, number of incidents, policy documents, and facility plans that you think would help with preparing the environmental review analysis for impacts to police services as a result of the proposed project.

Please reference our web-site at www.menlofire.org for any required or requested documents. See, in particular, Standards of Cover Assessment dated June 16, 2015.

10. In addition to concerns in the letters received by the City Council dated March 31, 2015 and June 16, 2015 regarding potential impacts to Station 77, are there any other concerns regarding potential impacts to the Fire Protection District as a result of the Project? If so, please describe.

The Fire District is concerned about increased demands for Fire Prevention/Code Enforcement, public education, recreational activity, in or around the Bay, which could lead to technical rescues and water recues and additional traffic congestion that comes with a greater level of density and population.

See also concerns about impacts of future growth and development in Standards of Coverage Report dated June 16, 2015. See information from Report quoted in response to Question #4.

The EIR should also address the issues raised in the District's letter on the NOP dated July 20, 2015.

Updated 11/10/2015 – HS

If you have any questions, please feel free to contact me at 510.848.3815.

Sincerely,

Ricky Caperton

POLICE PROTECTION SERVICES

PLACEWORKS

October 20, 2015

Dave Bertini, Commander
Menlo Park Police Department
701 Laurel Street
Menlo Park, CA 94025

Re: Police Protection Services

Dear Commander Bertini:

The City of Menlo Park is currently updating the Land Use and Circulation Elements of the General Plan, which were last comprehensively updated in 1994. In addition, the City is updating the Bayfront Area Zoning ordinance. Collectively, the updates are referred to as ConnectMenlo. Both the General Plan Update and the Zoning Ordinance Update are summarized below, followed by Table 1, which is the existing and proposed 2040 Horizon-Year Buildout Projections. As shown in the table, the projected growth for the proposed ConnectMenlo Project for the 2040 horizon year, plus the Current General Plan development potential (but not including Facebook Campus Expansion), is 4.1 million square feet of non-residential space, 400 hotel rooms and 5,500 residential units, and up to 14,150 new residents and 9,900 employees.

General Plan Update

The proposed Land Use and Circulation Elements are intended to guide development and conservation in the city through the 2040 buildout horizon of this General Plan. These two elements are central components of the General Plan because they describe which land uses should be allowed in the city, where those land uses should be located, how those land uses may be accessed and connected, and how development of those uses should be managed so as to minimize impacts and maximize benefits to the city and its residents. The Land Use Element frames the type and scale of potential development that may occur over the next 24 years, particularly in the Bayfront Area. The Circulation Element addresses transportation issues throughout the city. Both updated Elements have been written to be consistent with the other General Plan Elements and the 2012 El Camino Real/Downtown Specific Plan.

Bayfront Area Zoning Ordinance Update

The Project includes an update to the City's Zoning Ordinance for the Bayfront Area formerly referred to as the "M-2 General Industrial Zoning District", including both development regulations and design standards, to ensure consistency with the General Plan Update and previously adopted ordinances and policies. The proposed Zoning Ordinance Update would create the following five new districts, which would apply to lands within the Bayfront Area: Light Industrial (I-L), Business Park (C-BP), Office/Tech/Research and Development (O), Life Sciences (LS), and Mixed Use Residential (R-MU). These districts are intended to foster innovation and emerging technologies; promote the creation of an employment district with travel patterns that are oriented toward pedestrian, transit, and bicycle use; and provide amenities to surrounding neighborhoods and fiscal support to the City leveraged through development intensity bonuses. The standards for development within the LS and O districts allow increased development intensities with the provision of community amenities.

e. The Proposed Bayfront Area development potential represents increased development potential for the Bayfront Area only, but does not include the Facebook Campus Expansion Project, which is shown in a separate column.

f. The Maximum Citywide Buildout represents the total of the 5 previous columns.

g. Potential Commercial square footage in the Bayfront Area would occur within Office and Residential districts.

h. An unknown number of additional hotel rooms could be proposed under the current General Plan; Hotel square footage is not included in the Facebook Campus Expansion Project and Proposed Bayfront Area development potential non-residential square feet.

i. Assumes 2.57 persons per household per Association of Bay Area Governments (ABAG) *Projections 2013, Subregional Study Area Table*.

As part of the environmental review process required by the California Environmental Quality Act (CEQA) a determination must be made as to whether the project would not be adequately served by existing police protection service facilities thus requiring the construction of new facility or improvements to an existing facility that would result in a physical impact to the environment. In a November 19, 2014 interview with PlaceWorks, information was provided regarding Police Department staffing levels and response times. Below is an excerpt from Existing Conditions Reports that were released for public review in January 2015, including the information from the interview, followed by several questions. Because the information included in the Existing Conditions Reports was gathered in the previous fiscal year, information regarding number of staff, operating budget, equipment, may no longer reflect current existing conditions. Your input in confirming and/or updating the information below will help us to complete our environmental review and to make a determination of whether or not a significant environmental impact could occur as a result of the adoption of the proposed Project, pursuant to State CEQA Guidelines.

The General Plan Update and Zoning Ordinance Update that are the subject of this EIR consist of long-term plans that will be implemented as policy documents guiding future development activities and City actions through the year 2040. Because this is a program-level EIR, this document does not evaluate the impacts of specific, individual developments that may be allowed under the General Plan. Future specific projects may require separate environmental review.

To determine whether the proposed project would have the potential to have a significant environmental effect related to police protection services, the Draft Environmental Impact Report (Draft EIR) being prepared for the proposed project applies the following standard of significance:

> *Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for police services?*

The purpose of the Draft EIR is to assess the project's potential impacts to various environmental issue areas and public service and utility agencies, including the City of Menlo Park's public safety, provided by the Menlo Park Police Department. The Draft EIR will also provide recommendations that may be necessary to reduce such potential impacts to "less-than-significant" levels.

Below are excerpts from the 2015 Existing Conditions Report for the Project. Please confirm the information regarding staffing and response times, and any assistance that you can provide with the questions that follow would be greatly appreciated:

MENLO PARK POLICE DEPARTMENT

The Menlo Park Police Department (MPPD) provides law enforcement services in the City of Menlo Park. One police station, located at City Hall, primarily covers the whole service area. The MPPD operates one newly opened 1,800-square-foot substation on the bayside of US 101 in the Neighborhood Service Center, which is staffed and open to the public during normal business hours. The Belle Haven Neighborhood Service Center and Substation is also used for officers to use restrooms, make calls, or interview and process suspects, victims, or witnesses. The substation is also a location used during critical incidents in the Belle Haven neighborhood. The MPPD divides its service area by three beats:

- Beat 1 covers the area of the City on the hillside of El Camino Real
- Beat 2 covers the area between El Camino Real and US 101
- Beat 3 covers the bayside of US 101

The MPPD has a mutual aid agreement with every other police agency in the County of San Mateo. This agreement includes all neighboring jurisdictions: Atherton Police Department, East Palo Alto Police Department, Redwood City Police Department, and the San Mateo County Sherriff's Office, which is responsible for law enforcement in unincorporated areas of Menlo Park and Redwood City. The MPPD also has an informal mutual aid agreement with the Palo Alto Police Department which borders Menlo Park, but is in Santa Clara County.

STAFFING

MPPD staffing includes 48 sworn officers and 22 professional staff, resulting in a total full-time equivalent (FTE) of 70 as of 2014. The sworn officers consist of one chief, two commanders, eight sergeants, and 37 police officers, with a staffing ratio of 1.4 officers per 1,000 residents. Recent budget shortfalls in the City have resulted in staff deficiencies in the MPPD. To maintain service levels with limited budget, the MPPD has tightened its resources by assigning some sworn officer's tasks to non-sworn staff. Recently, MPPD has been able to revive its traffic unit with the staffing of two motorcycle positions. Currently there is one full time motorcycle traffic officer on duty with a second motorcycle officer in training.

RESPONSE TIMES

The MPPD prioritizes calls for police services as follows: Priority 1 calls involve life-threatening situations; Priority 2 calls are not life-threatening but necessitate immediate response; all other calls are designated Priority 3. In 2014, the average response time for Priority 1 calls was 3:35 minutes, for Priority 2 calls was 7:39 minutes, and for Priority 3 calls was 11:30 minutes. Vehicle traffic and congestion are the primary impediment to improving response times.

Call Volumes

From November 18, 2013 to November 18, 2014, the MPPD received 401 Priority 1 calls, 10,833 Priority 2 calls, and 10,507 Priority 3 calls for service. This does not include the 18,448 additional officer-initiated calls that the dispatch center handled. These officer initiated calls could be priority 1, 2, or 3 depending on their nature. The MPPD identified the Beat 3 area as a "crime hot spot" because of entrenched gang activity in the area and rival gangs in East Palo Alto, although violent crime has dramatically decreased throughout the City in 2014.

1. What is the current service population, including resident (fulltime) service population and daytime (with employees) service population? How does the Police Department account for employee service population?

2. Would the Menlo Park Police Department need to construct new facilities or expand existing facilities in order to accommodate the project's demand for police services?

3. What is the standard ratio of officers per number of population or acreage that the department would like to maintain? Is the Department currently meeting this ratio?

4. Does the Menlo Park Police Department have identified Developer Impact Fees for new commercial and residential development? If so, please describe the fees.

5. Does the Menlo Park Police Department have an established target response time for responding to Priority 1, 2, and 3 calls? If so, is the MPPD currently meeting those response times?

6. What is the existing equipment inventory at each station included in your response above?

7. Are there any existing deficiencies, such as lack of staffing and/or facilities and equipment?

8. Are the existing staff levels at the station(s) adequate to meet current demands for protection services in the project areas?

9. Are the equipment levels adequate to meet the project area's current demand for police protection services?

10. Are there any plans for expansion or relocation of stations that would serve the project? If so, please describe the expansion or relocation.

11. Would the project require the Menlo Park Police Department to hire more officers or staff?

12. Would the project require the Menlo Park Police Department to purchase more equipment?

13. Please provide recommendations that could reduce the demand for police services created by the proposed project.

14. Please provide any current documents on police service in the City including background reports, number of incidents, policy documents, and facility plans that you think would help with preparing the environmental review analysis for impacts to police services as a result of the proposed project.

If you have any questions, please feel free to contact me at 510.848.3815.

Sincerely,

Ricky Caperton

CITY OF MENLO PARK

November 18, 2015

Mr. Ricky Caperton
Placeworks
1625 Shattuck Ave. Suite 300
Berkeley, CA. 94709

RE: Police Protection Services – General Plan Update

Dear Mr. Caperton:

The Menlo Park Police Department is in receipt of your request for information regarding Police Protection Services as it relates to the City of Menlo Park General Plan update process. The description of the Police Department and its current staffing, along with facilities and service areas, remains the same as stated in the 2015 Existing Conditions Report (referenced in your letter). Below are the answers to the specific questions and requests for information:

1. Service Population-The current service population for the Menlo Park Police Department is 42,046. This number is derived by taking the total city population and adding 1/3 of all employees within the city.

2. Facilities-No new or expanded facilities are anticipated at this time. The City currently operates a police substation and neighborhood service center at the corner of Hamilton Ave., and Willow Road (north of Highway 101 in the Belle Haven neighborhood). This location opened in the spring of 2014, with funding provided by Facebook. The renovated facility is a location for community members to meet with law enforcement and each other and includes a new interior and free public Wi-Fi. The substation also houses the department's Code Enforcement Officer and Community Safety Police Officer.

3. Officer Ratio-The current ratio of officers to population is: 1.14 sworn for every 1,000 service population, with 48 sworn officers. This ratio has steadily increased over the last seven years. In 2008, the ratio of officers to service population was one officer per 605 residents (due to the fact the department had 52 sworn officers working within the three service areas). The average in San Mateo County is 1.25 sworn for every 1,000 service population. We would prefer to maintain an officer to population ratio of one sworn officer for every 1,000 service population, and at this time the department is meeting that ratio.

4. Developer Impact Fees-The Police Department does not levy nor collect "Developer Impact Fees".

5. Response Times- The department's optimal response time to calls for service is: less than 5 minutes for Priority 1 calls, 7-8 minutes for Priority 2 calls and 10-12

minutes for Priority 3 calls. Presently, the average response time for Priority 1 calls is slightly over 5 minutes, 8 minutes for Priority 2 calls, and 10 minutes for Priority 3 calls. These response times have increased over the past year, but are considered acceptable and within the average of response times throughout the County. Vehicle traffic and congestion is the primary impediment to improving response times.

6. Equipment Inventory-The existing inventory of equipment for the Police Department is currently sufficient to equip all sworn officers and non-sworn professional staff. The Police Department also maintains a small equipment reserve to cover breakage and routine maintenance.

7. Existing Deficiencies- At this time, there are no existing deficiencies in sworn staffing or facilities and equipment. The one area of deficiency is in Code Enforcement services. Unlike many other municipalities, Code Enforcement is operated through the Police Department and is currently staffed with one full-time, non-sworn employee. In the past, Code Enforcement was staffed with sworn personnel, including one Police Sergeant, one Police Officer and one non-sworn expert. With the current level of development and demand by residents, the current non-sworn Code Enforcement Officer is not able to conduct any proactive enforcement and is also unable to respond to complaints in a timely manner. The Police Department is currently supplementing Code Enforcement services with non-sworn Community Service Officers, which detracts from their normal duties.

8. Current Demands-Currently, existing staffing levels are adequate to meet current demands for services, except for those listed above, in #7.

9. Equipment Levels-Currently, existing equipment levels are adequate to meet the current demands for services.

10. Expansion or Relocation Plans-At this time, there are no plans to relocate or expand any stations for the Police Department. It should be noted that all day-to-day operations are conducted through the main Police Department which is located in the basement level of City Hall at 701 Laurel Street. The City Service Center/Substation only houses the Code Enforcement Officer and City Safety Police Officer, two specialized positions, and is a location for officers who are housed at the main station to use when operating in the beat-3 area.

11. Staffing-The "Maximum Citywide 2040 Buildout" indicates a possible increase of 17,450 in city population and 22,350 in employees within the city, by the year 2040. This scenario increases the service population to 67,922, which is a significant increase from the current population. In order to maintain the 1:1000 sworn officer ratio, sworn staff would need to be increased by 19 positions, along with commensurate equipment for those positions. This figure could be affected by any change in crime, traffic, or other new or changing demands for police services.

    The "Proposed Project-Bayfront Area" indicates a possible increase of 11,570 in population and an increase of 5,500 in employees within the city. This scenario increases the service population to 55,431. In order to maintain the 1:1000 sworn officer ratio, sworn staff would need to be increased by 7 along with commensurate equipment for these positions.

The “Current General Plan” indicates a possible increase of 2,580 in population and an increase of 4,400 in employees within the city. This scenario increases the service population to 44,626. In this scenario, no increases in staffing or equipment would be needed.

It should be noted that, in any of the above three scenarios, code enforcement services would be deficient under current levels and would need to be increased.

12. Equipment Purchase- As stated above, in two of the listed scenarios, equipment levels would need to be increased commensurate with the increased number of sworn officers.

13. Plans for Reduced Demand-Reducing demand for police services created by the proposed projects could include: built in surveillance equipment and security staffing to monitor those systems, use of Crime Prevention Through Environmental Design (CPTED) recommendations and procedures during the design and construction of each project, hired security personnel to monitor project areas and upgraded traffic planning in order to minimize traffic accidents and congestion.

14. Background Documents-Specific documents are available upon request.

Sincerely,

David C. Bertini

Commander Dave Bertini
Menlo Park Police Department

PARKS AND RECREATION SERVICES

October 20, 2015

Cherise Brandell, Community Services Director
Menlo Park Community Services
701 Laurel Street
Menlo Park, CA 94025

Re: Parks and Recreational Services

Dear Cherise Brandell:

The City of Menlo Park is currently updating the Land Use and Circulation Elements of the General Plan, which were last comprehensively updated in 1994. In addition, the City is updating the Bayfront Area Zoning ordinance. Collectively, the updates are referred to as ConnectMenlo. Both the General Plan Update and the Zoning Ordinance Update are summarized below, followed by Table 1, which is the existing and proposed 2040 Horizon-Year Buildout Projections. As shown in the table, the projected growth for the proposed ConnectMenlo Project for the 2040 horizon year, plus the Current General Plan development potential (but not including Facebook Campus Expansion), is 4.1million square feet of non-residential space, 400 hotel rooms and 5,500 residential units, and up to 14,150 new residents and 9,900 employees.

General Plan Update

The proposed Land Use and Circulation Elements are intended to guide development and conservation in the city through the 2040 buildout horizon of this General Plan. These two elements are central components of the General Plan because they describe which land uses should be allowed in the city, where those land uses should be located, how those land uses may be accessed and connected, and how development of those uses should be managed so as to minimize impacts and maximize benefits to the city and its residents. The Land Use Element frames the type and scale of potential development that may occur over the next 24 years, particularly in the Bayfront Area. The Circulation Element addresses transportation issues throughout the city. Both updated Elements have been written to be consistent with the other General Plan Elements and the 2012 El Camino Real/Downtown Specific Plan.

Bayfront Area Zoning Ordinance Update

The Project includes an update to the City's Zoning Ordinance for the Bayfront Area formerly referred to as the "M-2 General Industrial Zoning District", including both development regulations and design standards, to ensure consistency with the General Plan Update and previously adopted ordinances and policies. The proposed Zoning Ordinance Update would create the following five new districts, which would apply to lands within the Bayfront Area: Light Industrial (I-L), Business Park (C-BP), Office/Tech/Research and Development (O), Life Sciences (LS), and Mixed Use Residential (R-MU). These districts are intended to foster innovation and emerging technologies; promote the creation of an employment district with travel patterns that are oriented toward pedestrian, transit, and bicycle use; and provide amenities to surrounding neighborhoods and fiscal support to the City leveraged through development intensity bonuses. The standards for development within the LS and O districts allow increased development intensities with the provision of community amenities.

Notes: *Numbers are estimates and rounded for the purposes of this programmatic environmental review.*

a. Includes existing development on the ground.

b. Includes reasonably foreseeable projects (i.e. pending applications, recently approved, or under construction) in the Study Area; including the current Facebook Campus Expansion Project shown in a separate column. A list of approved projects is shown in Chapter 4, Environmental Evaluation, of this Draft EIR.

TABLE 1 EXISTING AND PROPOSED 2040 HORIZON-YEAR BUILDOUT PROJECTIONS

Category	Existing Conditions[a]	+	"Approved" Projects[b]	+	Current General Plan[c]	+	Proposed Project (Bayfront Area)[d]	=	Maximum Citywide 2040 Buildout[e]

d. This represents what could be built if the proposed ConnectMenlo project were not approved, which is the "No Project" condition discussed in Chapter 5, Alternatives to the Proposed Project, of this Draft EIR.

e. The Proposed Bayfront Area development potential represents increased development potential for the Bayfront Area only, but does not include the Facebook Campus Expansion Project, which is shown in a separate column.

f. The Maximum Citywide Buildout represents the total of the 5 previous columns.

g. Potential Commercial square footage in the Bayfront Area would occur within Office and Residential districts.

h. An unknown number of additional hotel rooms could be proposed under the current General Plan; Hotel square footage is not included in the Facebook Campus Expansion Project and Proposed Bayfront Area development potential non-residential square feet.

i. Assumes 2.57 persons per household per Association of Bay Area Governments (ABAG) *Projections 2013, Subregional Study Area Table*.

As part of the environmental review process required by the California Environmental Quality Act (CEQA) a determination must be made as to whether the project would not be adequately served by existing parks and recreation facilities thus requiring the construction of new facility or improvements to an existing facility that would result in a physical impact to the environment. Below is an excerpt from Existing Conditions Reports that were released for public review in January 2015, including the information from the interview, followed by several questions. Because the information included in the Existing Conditions Reports was gathered in the previous fiscal year, information regarding parks and recreational facilities may no longer reflect current existing conditions. Your input in confirming and/or updating the information below will help us to complete our environmental review and to make a determination of whether or not a significant environmental impact could occur as a result of the adoption of the proposed Project, pursuant to State CEQA Guidelines.

The General Plan Update and Zoning Ordinance Update that are the subject of this EIR consist of long-term plans that will be implemented as policy documents guiding future development activities and City actions through the year 2040. Because this is a program-level EIR, this document does not evaluate the impacts of specific, individual developments that may be allowed under the General Plan. Future specific projects may require separate environmental review.

To determine whether the proposed project would have the potential to have a significant environmental effect related to **parks and recreation services**, the Draft Environmental Impact Report (Draft EIR) being prepared for the proposed project applies the following standard of significance:

> *Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for parks and recreation services?*

The purpose of the Draft EIR is to assess the project's potential impacts to various environmental issue areas and public service and utility agencies, including the City of Menlo Park's parks and recreation facilities. The Draft EIR will also provide recommendations that may be necessary to reduce such potential impacts to "less-than-significant" levels.

Below are excerpts from the 2015 Existing Conditions Report for the Project. Please confirm the information, and any assistance that you can provide with the questions that follow would be greatly appreciated:

PARK AND RECREATION FACILITIES

Public park and recreation facilities are an important facet of Menlo Park's high quality of life and are generally considered to be in adequate or good states of repair. Menlo Park currently has 265.1 acres of park space, and community and recreation facilities, with these facilities spread out across the city. Table 8 shows the acreages for all City park, recreation, and community facilities, and Figure 12 shows their locations. A significant portion of Menlo Park's parkland is contained in Bedwell Bayfront Park, which also represents a potential opportunity for improvements to existing facilities. Going forward, planning for improvements to this and other park facilities will require carefully balancing competing needs. For example, Bedwell Bayfront Park could potentially benefit from increased tree cover and from new picnic facilities; however, such improvements could serve to attract birds of prey, which would impact the ecosystem of the park. Alternatively, improvements to the restrooms at Bedwell Bayfront Park could be carried out in an environmentally sensitive manner; however, although these upgrades have been considered by Capital Improvements Plans for the future, funding is not currently in place for the project.

Similarly, there are a number of improvements for parks and recreation facilities that are planned for in applicable Capital Improvements Plans, although funding has yet to be secured. For example, at Kelly Park, a new soccer field with new fixtures and turf has seen sustained high use, but a project to install a sound wall adjacent to the field has yet to receive funding. The Belle Haven Swimming Pool is another popular recreation facility where funding could allow for new upgrades. Originally designed for brief, seasonal use, the pool has become a year-round attraction, leading to a need for an improved heating system for the pool, new lighting, and expanded locker and shower facilities. Funding is currently in place to conduct an audit to determine the full extent of these needs; but the additional funding necessary to make improvements to the pool has not yet been secured. In addition, dog park facilities in Menlo Park are in need of improvement. Currently, the softball field at Nealon Park doubles as both a ball field and as a dog park during weekday mornings. Although this arrangement has worked for some time, a need to separate facilities is contemplated in the Capital Improvements Plan.

TABLE 8 PARK, RECREATION, AND COMMUNITY FACILITIES IN MENLO PARK

FACILITY NAME	ACREAGE
CITY PARK FACILITIES	
Bedwell Bayfront Park	155
Burgess Park	9.3
Fremont Park	0.4
Hamilton Park	1.2
Jack W. Lyle Park	4.6
Joseph P. Kelly Park	8.3
Market Place Park	1
Nealon Park	9
Seminary Oaks Park	3.5
Sharon Hills Park	12.5
Sharon Park	9.8
Stanford Hills Park	3.1
Tinker Park	0.5
Willow Oaks Park	2.6
Subtotal	**220.8**[a]
COUNTY PARK FACILITIES	
Flood Park	24.1
Total of All Park Facilities	**245**
CITY RECREATION/COMMUNITY FACILITIES	
Belle Haven Child Development Center	0.7
Belle Haven Community Library	0.6
Belle Haven Neighborhood Service Center and Substation	0.1
Menlo Park Civic Center	14.7 [b]
Onetta Harris Community Center	3.9
Total of Recreation/Community Facilities	20.1
Grand Total	**265.1**

a. Subtotal has appearance of being off by 0.1 acres due to rounding errors.
b. Acreage for this facility excludes Burgess Park acreage.

Source: City of Menlo Park Zoning Map data and PlaceWorks, 2014.

Additional underserved service needs in Menlo Park include child care and senior center services. With regard to Senior Centers, operating hours are currently limited to 9:00 a.m. to 3:00 p.m., but there are members of the senior population who could benefit from extended hours of operation. Additional staff and staff training could allow future service expansions, potentially including additional capacity to host and provide support for special-needs populations. Similarly, childcare programs for low-income households in Belle Haven are currently at capacity and experience long waiting lists for childcare at the more highly subsidized slots serving the lowest income categories. Additional funding for new classroom space and staff positions at the Belle Haven childcare center could allow for capacity increases that would help reduce or eliminate waitlists.

1. Is the information on the location and size of parks and open spaces available identified in the table above accurate? If not, please provide updated information on the size and/or location of parks.

2. According to Chapter 15.16.020 of the City's Municipal Code, there is a requirement of in-lieu fees and/or dedication of parkland to mitigation impacts to parks and recreation facilities – what are the current fees for residential and/or commercial development?

3. Are there any plans for new or expanded recreational facilities beyond what is identified in the existing conditions text above? If so, please provide specific details including expansion location, size, and new facilities.

4. Does the City currently meet its adopted goal of maintaining a ratio of five acres of developed parkland per 1,000 residents?

5. Please provide recommendations that could reduce the demand for park and recreational services created by the proposed project.

6. Are there any other issues related to maintaining the adequacy of parkland per the City's adopted goal? If so, please provide details.

7. Please provide any current documents on park and recreational services in the City including background reports, policy documents, and facility plans that you think would help with preparing the environmental review analysis for impacts to park and recreational services as a result of the proposed project.

If you have any questions, please feel free to contact me at 510.848.3815.

Sincerely,

Ricky Caperton

Menlo Park Community Services Department

Response to October 20 Memo re Parks and Recreational Services

1. Information on location and size of parks and open spaces in the attached table is accurate
2. Please contact the Planning Department for information on in-lieu fees to mitigate impacts to parks and recreation
3. There are no plans for “new” or expanded facilities beyond what is described in the existing conditions report
4. The City currently meets the adopted goal of five acres of parkland per 1000, however, if the 155 acre Bedwell Bayfront Park is removed from the list (the park is isolated in one corner of the community and difficult for most residents to access) the ratio is greatly impacted.
5. Staff feels the following facilities additions (along with commensurate programming and maintenance staff) would be required to serve the additional residents and employees projected in the project:
    a. Addition of open space amenities at Bedwell Bayfront Park (trails, interpretive programming, Rangers, all to be identified by community in upcoming Master Plan Update)
    b. Ped / Bike bridge to Bedwell Bayfront Park over Bayfront Expressway
    c. Additional Field Space (ie partnership with San Mateo County to upgrade fields at Flood Park)
    d. Accessibility improvements to Onetta Harris Campus ie ped/bike crossing at Dumbarton Rail line
    e. Updated pool facility similar to Burgess Campus Pool
    f. Additional partnerships and spaces for child care programs
    g. Additional partnerships and spaces for after school programs
    h. Funding for expansion of hours and services at the Senior Center
    i. If a new “neighborhood” is created, parkland needs to be acquired / included
6. Maintenance staff are stretched to capacity with current facilities. If additional facilities come on line, maintenance staffing and budgets would need to increase as well as programming and operational staff
7. Community Services Department 2025 Strategic Plans (drafts) are attached. Within the next 6 months, Menlo Park Community Services will have the results of our assessment by PRORAGIS, the National Parks and Recreation Association’s national benchmarking program and we will be able to provide more specific comparisons of where our facilities measure up to national standards.

SCHOOL SERVICES

October 20, 2015

Carolyn Chow, Chief Business Officer
Las Lomitas Elementary School District
1011 Altschul Avenue
Menlo Park, CA 94025

Re: School Services

Dear Carolyn Chow:

The City of Menlo Park is currently updating the Land Use and Circulation Elements of the General Plan, which were last comprehensively updated in 1994. In addition, the City is updating the Bayfront Area Zoning ordinance. Collectively, the updates are referred to as ConnectMenlo. Both the General Plan Update and the Zoning Ordinance Update are summarized below, followed by Table 1, which is the existing and proposed 2040 Horizon-Year Buildout Projections. As shown in the table, the projected growth for the proposed ConnectMenlo Project for the 2040 horizon year, plus the Current General Plan development potential (but not including Facebook Campus Expansion), is 4.1 million square feet of non-residential space, 400 hotel rooms and 5,500 residential units, and up to 14,150 new residents and 9,900 employees.

General Plan Update

The proposed Land Use and Circulation Elements are intended to guide development and conservation in the city through the 2040 buildout horizon of this General Plan. These two elements are central components of the General Plan because they describe which land uses should be allowed in the city, where those land uses should be located, how those land uses may be accessed and connected, and how development of those uses should be managed so as to minimize impacts and maximize benefits to the city and its residents. The Land Use Element frames the type and scale of potential development that may occur over the next 24 years, particularly in the Bayfront Area. The Circulation Element addresses transportation issues throughout the city. Both updated Elements have been written to be consistent with the other General Plan Elements and the 2012 El Camino Real/Downtown Specific Plan.

Bayfront Area Zoning Ordinance Update

The Project includes an update to the City's Zoning Ordinance for the Bayfront Area formerly referred to as the "M-2 General Industrial Zoning District", including both development regulations and design standards, to ensure consistency with the General Plan Update and previously adopted ordinances and policies. The proposed Zoning Ordinance Update would create the following five new districts, which would apply to lands within the Bayfront Area: Light Industrial (I-L), Business Park (C-BP), Office/Tech/Research and Development (O), Life Sciences (LS), and Mixed Use Residential (R-MU). These districts are intended to foster innovation and emerging technologies; promote the creation of an employment district with travel patterns that

are oriented toward pedestrian, transit, and bicycle use; and provide amenities to surrounding neighborhoods and fiscal support to the City leveraged through development intensity bonuses. The standards for development within the LS and O districts allow increased development intensities with the provision of community amenities.

Notes: *Numbers are estimates and rounded for the purposes of this programmatic environmental review.*

a. Includes existing development on the ground.

b. Includes reasonably foreseeable projects (i.e. pending applications, recently approved, or under construction) in the Study Area; including the current Facebook Campus Expansion Project shown in a separate column. A list of approved projects is shown in Chapter 4, Environmental Evaluation, of this Draft EIR.

d. This represents what could be built if the proposed ConnectMenlo project were not approved, which is the "No Project" condition discussed in Chapter 5, Alternatives to the Proposed Project, of this Draft EIR.

e. The Proposed Bayfront Area development potential represents increased development potential for the Bayfront Area only, but does not include the Facebook Campus Expansion Project, which is shown in a separate column.

f. The Maximum Citywide Buildout represents the total of the 5 previous columns.

g. Potential Commercial square footage in the Bayfront Area would occur within Office and Residential districts.

h. An unknown number of additional hotel rooms could be proposed under the current General Plan; Hotel square footage is not included in the

TABLE 1 EXISTING AND PROPOSED 2040 HORIZON-YEAR BUILDOUT PROJECTIONS

Category	Existing Conditions[a]	+	"Approved" Projects[b]	+	Current General Plan[c]	+	Proposed Project (Bayfront Area)[d]	=	Maximum Citywide 2040 Buildout[e]

Facebook Campus Expansion Project and Proposed Bayfront Area development potential non-residential square feet.

i. Assumes 2.57 persons per household per Association of Bay Area Governments (ABAG) *Projections 2013, Subregional Study Area Table*.

As part of the environmental review process required by the California Environmental Quality Act (CEQA) a determination must be made as to whether the project would not be adequately served by existing school facilities thus requiring the construction of new facility or improvements to an existing facility that would result in a physical impact to the environment. Below are several questions to be addressed. Your input will help us to complete our environmental review and to make a determination of whether or not a significant environmental impact could occur as a result of the adoption of the proposed Project, pursuant to State CEQA Guidelines.

The General Plan Update and Zoning Ordinance Update that are the subject of this EIR consist of long-term plans that will be implemented as policy documents guiding future development activities and City actions through the year 2040. Because this is a program-level EIR, this document does not evaluate the impacts of specific, individual developments that may be allowed under the General Plan. Future specific projects may require separate environmental review.

To determine whether the proposed project would have the potential to have a significant environmental effect related to school services, the Draft Environmental Impact Report (Draft EIR) being prepared for the proposed project applies the following standard of significance:

> *Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for school services?*

The purpose of the Draft EIR is to assess the project's potential impacts to various environmental issue areas and public service and utility agencies, including the City of Menlo Park's school facilities. The Draft EIR will also provide recommendations that may be necessary to reduce such potential impacts to "less-than-significant" levels.

Any assistance that you can provide with the following questions would be greatly appreciated:

1. What is the capacity of the schools that would serve Menlo Park, and what is the current enrollment? Does the School District currently exceed its student capacity? If so, by how much?

2. What are the student enrollment projections for the schools that would serve Menlo Park? Does the School District anticipate that enrollment will exceed capacity at any of the schools?

3. What are the student generation rates the District uses to determine enrollment projections?

4. Does the District assess development fees for new commercial and residential development? If so, what are the fees?

5. Are there any plans for new or expanded school facilities? If so, where, to what extent, and when are the expanded or new facilities expected to be commence?

6. Is there a teacher to student ratio or some other performance standard established that the District must maintain? If so, what are those standards and is the District currently meeting those standards?

7. Are there any other issues related to maintaining the adequacy and quality of school facilities? If so, please provide details.

8. Would the District need to construct new or expand existing facilities to accommodate the Project?

9. Please provide any current documents on school services in the City including background reports, policy documents, and facility plans that you think would help with preparing the environmental review analysis for impacts to school facilities as a result of the proposed project.

If you have any questions, please feel free to contact me at 510.848.3815.

Sincerely,

Ricky Caperton

Connect Menlo Project

<u>Response to PlaceWorks Questions:</u>

1. The Las Lomitas Elementary School District operates two schools: Las Lomitas Elementary School and La Entrada Middle school. There are 581 students enrolled at Las Lomitas and 803 at La Entrada, for a total district enrollment of 1,384. The District has experienced a growth in enrollment and both schools are overcapacity. There are currently 25 portable classroom buildings between the two sites to house students and operate instructional programs.

2. The District bases its enrollment data on demographic studies conducted by Tom Williams of Enrollment Projection Consultants. The most recent data projects the following student enrollment:
   2016-17: 1,406
   2017-18: 1,419
   2018-19: 1,425
   2020-21: 1,413
   2023-24: 1,478

   Enrollment data is closely monitored because at this level of facility overcapacity, in addition to hiring new staff, portable classrooms need to be installed as new students are enrolled. Projections beyond 2018-19 are challenging since kindergarten students for these out years are not yet born.

   Single Family Dwellings account for 78% of the total enrollment. Enrollment from this housing type grew 14% between 2008 and 2011. Enrollment of students living in attached units (condos, apartments, townhouses, etc.) increased 26% between 2008 and 2011 and accounts for 15% of total enrollment.

   Our demographic study projects the district to reach a maximum student enrollment of nearly 1,500 in 2023. Additional facilities to house these students, and any number beyond 1,500, will require the community to support another bond measure.

3. Projections are based upon middle sized single family dwellings generating 0.4 students per home (see attached Enrollment Projection Report, March 2014).

4. The District assesses a one-time Developer Fee for new residential and commercial development on a revenue sharing model with the Sequoia Union High School District. The fee is $3.36/sq. ft. for residential and $0.54/sq. ft. for commercial. Of this amount, the District receives 60% ($2.016 for residential and $0.32 for commercial) and the high school district receives 40%.

5. The District passed a $60 million facilities bond (Measure S) in Nov. 2013 for the purpose of building additional permanent classrooms for students and removing the portable classrooms added in recent years. This $60 will allow the District to add only the number of new classrooms necessary to replace the existing portable classrooms.

The District has been working with CAW Architects and is currently in the programming and conceptual design phase for the La Entrada Middle School. We plan on entering into design development and construction documents in January 2016, followed by a five month DSA review period beginning in fall 2016, and breaking ground for construction in January 2017. Las Lomitas Elementary School will follow a similar schedule and they are approximately six months behind the La Entrada timeline.

6. The student to teacher ratio in grades kindergarten through 3rd cannot exceed 24:1. The ratio for grades 4 and 5 is a maximum of 25:1, and it is 28:1 for grades 6-8. The District is currently meeting these staffing ratios. The Las Lomitas Education Foundation raises approximately 11% of the District's annual revenue based on class sizes being within these ranges.

7. Available space and new funding sources are the biggest challenges to maintaining the adequacy of quality school facilities. The community has been supportive of building new facilities to get students out of portable classrooms with the 2013 passage of Measure S. We hope the community will again support another bond measure in the near future to modernize existing classrooms and complete the balance of the $120 million in projects identified in the Facilities Master Plan. Beyond these two bonds, it becomes highly questionable if the residents of the community can willingly and feasibly support additional facilities bonds.

8. A project of this size and scope is likely to have a considerable impact on the Las Lomitas School District. The District is a very desirable school district for families who value education and want to send their children to public schools. The type of employees likely to be working at the new "innovation and emerging technologies" development would be highly educated and have the level of income to live in Menlo Park and surrounding neighborhoods. These families tend to seek out high performing school districts and make housing decisions based upon the school district to which they wish to send their children.

   Both school sites are currently overcapacity. Expanding a K-3 elementary school that has an enrollment of nearly 600 students is not an educationally responsible decision. The same holds true for growing a middle school beyond 900 students. The District would need to construct new school facilities to accommodate the Project.

   Findings from the attached Development Impact Fee Justification back in 2008 establish that the District has no excess capacity; "it will need additional school facilities to accommodate students generated from new development projects."

9. See attached:
   Development Impact Fee Justification, 2008
   Review and Update of the Development Impact Fee Justification, 2012
   Enrollment Projection Report, March 2014
   CAW Facilities Master Plan, June 2015

October 20, 2015

Maurice Ghysels, Superintendent
Menlo Park City School District
181 Encinal Avenue
Atherton, CA 94027

Re: School Services

Dear Maurice Ghysels:

The City of Menlo Park is currently updating the Land Use and Circulation Elements of the General Plan, which were last comprehensively updated in 1994. In addition, the City is updating the Bayfront Area Zoning ordinance. Collectively, the updates are referred to as ConnectMenlo. Both the General Plan Update and the Zoning Ordinance Update are summarized below, followed by Table 1, which is the existing and proposed 2040 Horizon-Year Buildout Projections. As shown in the table, the projected growth for the proposed ConnectMenlo Project for the 2040 horizon year, plus the Current General Plan development potential (but not including Facebook Campus Expansion), is 4.1 million square feet of non-residential space, 400 hotel rooms and 5,500 residential units, and up to 14,150 new residents and 9,900 employees.

General Plan Update

The proposed Land Use and Circulation Elements are intended to guide development and conservation in the city through the 2040 buildout horizon of this General Plan. These two elements are central components of the General Plan because they describe which land uses should be allowed in the city, where those land uses should be located, how those land uses may be accessed and connected, and how development of those uses should be managed so as to minimize impacts and maximize benefits to the city and its residents. The Land Use Element frames the type and scale of potential development that may occur over the next 24 years, particularly in the Bayfront Area. The Circulation Element addresses transportation issues throughout the city. Both updated Elements have been written to be consistent with the other General Plan Elements and the 2012 El Camino Real/Downtown Specific Plan.

Bayfront Area Zoning Ordinance Update

The Project includes an update to the City's Zoning Ordinance for the Bayfront Area formerly referred to as the "M-2 General Industrial Zoning District", including both development regulations and design standards, to ensure consistency with the General Plan Update and previously adopted ordinances and policies. The proposed Zoning Ordinance Update would create the following five new districts, which would apply to lands within the Bayfront Area: Light Industrial (I-L), Business Park (C-BP), Office/Tech/Research and Development (O), Life Sciences (LS), and Mixed Use Residential (R-MU). These districts are intended to foster innovation and emerging technologies; promote the creation of an employment district with travel patterns that

are oriented toward pedestrian, transit, and bicycle use; and provide amenities to surrounding neighborhoods and fiscal support to the City leveraged through development intensity bonuses. The standards for development within the LS and O districts allow increased development intensities with the provision of community amenities.

5. Are there any plans for new or expanded school facilities? If so, where, to what extent, and when are the expanded or new facilities expected to be commence?

6. Is there a teacher to student ratio or some other performance standard established that the District must maintain? If so, what are those standards and is the District currently meeting those standards?

7. Are there any other issues related to maintaining the adequacy and quality of school facilities? If so, please provide details.

8. Would the District need to construct new or expand existing facilities to accommodate the Project?

9. Please provide any current documents on school services in the City including background reports, policy documents, and facility plans that you think would help with preparing the environmental review analysis for impacts to school facilities as a result of the proposed project.

If you have any questions, please feel free to contact me at 510.848.3815.

Sincerely,

Ricky Caperton

1. What is the capacity of the schools that would serve Menlo Park, and what is the current enrollment? Does the School District currently exceed its student capacity? If so, by how much?

   The District is currently beyond its target at Oak Knoll, Encinal, and Laurel Elementary Schools. The District is building a new elementary school that will expand its capacity.

   The reconfiguration will occur in 2016-17 with the opening of Laurel School Upper Campus.

   2016-17 Configuration

   Encinal School (K-5) Target Capacity: 720

   Oak Knoll School (K-5) Target Capacity: 720

   Laurel School Lower Campus (K-2) Target Capacity: 360

   Laurel School Upper Campus (3-5): 360

   Hillview School (6-8) Target Capacity: 1100

2. What are the student enrollment projections for the schools that would serve Menlo Park? Does the School District anticipate that enrollment will exceed capacity at any of the schools?

   See attached Enrollment Projections Study that was recently completed.

3. What are the student generation rates the District uses to determine enrollment projections?

   Reference EPC Report dated 2015. SGR of 0.44 for new single family housing and 0.18 for attached housing.

4. Does the District assess development fees for new commercial and residential development? If so, what are the fees?

   Yes, the District collects developer fees to the statutory limit of $3.36 per square foot for residential and up to $.54 per square foot for commercial/industrial. This collection is shared with Sequoia Union High School District. At the 60% rate, the District's portion would be $2.016 per square foot for residential.

5. Are there any plans for new or expanded school facilities? If so, where, to what extent, and when are the expanded or new facilities expected to be commence?

Yes, see response to question 1. Reference web site at

http://district.mpcsd.org/modules/cms/pages.phtml?pageid=304267&

6. Is there a teacher to student ratio or some other performance standard established that the District must maintain? If so, what are those standards and is the District currently meeting those standards?

District Policy is to keep K-3 at 1:20 and 4-8 at 1:24 with a flexibility of +/- 3 students. Yes, The District does maintain the class targets in the Board policy.

7. Are there any other issues related to maintaining the adequacy and quality of school facilities? If so, please provide details.

District facilities are in good condition with recent expansions and modernization work. District's has long-term maintenance program and funding allocation.

8. Would the District need to construct new or expand existing facilities to accommodate the Project?

The District target capacity with the expanded school is 3,300 students with average classes of 360 students per grade level. Beyond this limit the District will need to expand existing schools or build new schools. Because the availability of land is limited at the schools, especially its single middle, school expansion is not possible. The elementary schools are built out completely and further expansion would aggravate local traffic.

It is important to note that the expansion of residential housing in the "Bayfront" area is not in the District's boundary. See attached school locater link that defines the District's boundary area.

http://locator.decisioninsite.com/?studyID=113757

New housing in the District boundary which the District has not accounted for in its enrollment study that produces students beyond the 3300 capacity will have a facility impact to the District. The current per pupil cost is $14,100. Additional students, will have an impact to the District' finances as it the District is a community funded school and does not receive additional funding per student. Reference attached web site regarding District finances.

http://finance.district.mpcsd.org/modules/groups/integrated_home.phtml?gid=1573172&

Please note that while the Bayfront area is not in the Menlo Park City School District, however the increased employment from the area will have a direct impact to the MPCSD. MPCSD is a high performing school District, which is very attractive to parents. Many of the new employees with have families (current and future) may find the District attractive and locate in the MPCSD boundary. We have seen that with the current Facebook expansion and job market that housing demands remain high. MPCSD has seen a 38% student growth in the last 10 years. I have attached our most updated projection that does not include the proposed project.

9. Please provide any current documents on school services in the City including background reports, policy documents, and facility plans that you think would help with preparing the environmental review analysis for impacts to school facilities as a result of the proposed project.

October 20, 2015

Kevin Sved, Planning and Development Consultant
Ravenswood City School District
2120 Euclid Avenue
East Palo Alto, CA 94303

Re: School Services

Dear Kevin Sved:

The City of Menlo Park is currently updating the Land Use and Circulation Elements of the General Plan, which were last comprehensively updated in 1994. In addition, the City is updating the Bayfront Area Zoning ordinance. Collectively, the updates are referred to as ConnectMenlo. Both the General Plan Update and the Zoning Ordinance Update are summarized below, followed by Table 1, which is the existing and proposed 2040 Horizon-Year Buildout Projections. As shown in the table, the projected growth for the proposed ConnectMenlo Project for the 2040 horizon year, plus the Current General Plan development potential (but not including Facebook Campus Expansion), is 4.1 million square feet of non-residential space, 400 hotel rooms and 5,500 residential units, and up to 14,150 new residents and 9,900 employees.

General Plan Update

The proposed Land Use and Circulation Elements are intended to guide development and conservation in the city through the 2040 buildout horizon of this General Plan. These two elements are central components of the General Plan because they describe which land uses should be allowed in the city, where those land uses should be located, how those land uses may be accessed and connected, and how development of those uses should be managed so as to minimize impacts and maximize benefits to the city and its residents. The Land Use Element frames the type and scale of potential development that may occur over the next 24 years, particularly in the Bayfront Area. The Circulation Element addresses transportation issues throughout the city. Both updated Elements have been written to be consistent with the other General Plan Elements and the 2012 El Camino Real/Downtown Specific Plan.

Bayfront Area Zoning Ordinance Update

The Project includes an update to the City's Zoning Ordinance for the Bayfront Area formerly referred to as the "M-2 General Industrial Zoning District", including both development regulations and design standards, to ensure consistency with the General Plan Update and previously adopted ordinances and policies. The proposed Zoning Ordinance Update would create the following five new districts, which would apply to lands within the Bayfront Area: Light Industrial (I-L), Business Park (C-BP), Office/Tech/Research and Development (O), Life Sciences (LS), and Mixed Use Residential (R-MU). These districts are intended to foster innovation and emerging technologies; promote the creation of an employment district with travel patterns that

are oriented toward pedestrian, transit, and bicycle use; and provide amenities to surrounding neighborhoods and fiscal support to the City leveraged through development intensity bonuses. The standards for development within the LS and O districts allow increased development intensities with the provision of community amenities.

Employees	***30,900***		***12,450***		***4,400***		***5,500***		***53,250***

Notes: *Numbers are estimates and rounded for the purposes of this programmatic environmental review.*

a. Includes existing development on the ground.

b. Includes reasonably foreseeable projects (i.e. pending applications, recently approved, or under construction) in the Study Area; including the current Facebook Campus Expansion Project shown in a separate column. A list of approved projects is shown in Chapter 4, Environmental Evaluation, of this Draft EIR.

d. This represents what could be built if the proposed ConnectMenlo project were not approved, which is the "No Project" condition discussed in Chapter 5, Alternatives to the Proposed Project, of this Draft EIR.

e. The Proposed Bayfront Area development potential represents increased development potential for the Bayfront Area only, but does not include the Facebook Campus Expansion Project, which is shown in a separate column.

TABLE 1 EXISTING AND PROPOSED 2040 HORIZON-YEAR BUILDOUT PROJECTIONS

Category	Existing Conditions[a]	+	"Approved" Projects[b]	+	Current General Plan[c]	+	Proposed Project (Bayfront Area)[d]	=	Maximum Citywide 2040 Buildout[e]

f. The Maximum Citywide Buildout represents the total of the 5 previous columns.
g. Potential Commercial square footage in the Bayfront Area would occur within Office and Residential districts.
h. An unknown number of additional hotel rooms could be proposed under the current General Plan; Hotel square footage is not included in the Facebook Campus Expansion Project and Proposed Bayfront Area development potential non-residential square feet.
i. Assumes 2.57 persons per household per Association of Bay Area Governments (ABAG) *Projections 2013, Subregional Study Area Table*.

As part of the environmental review process required by the California Environmental Quality Act (CEQA) a determination must be made as to whether the project would not be adequately served by existing school facilities thus requiring the construction of new facility or improvements to an existing facility that would result in a physical impact to the environment. Below are several questions to be addressed. Your input will help us to complete our environmental review and to make a determination of whether or not a significant environmental impact could occur as a result of the adoption of the proposed Project, pursuant to State CEQA Guidelines.

The General Plan Update and Zoning Ordinance Update that are the subject of this EIR consist of long-term plans that will be implemented as policy documents guiding future development activities and City actions through the year 2040. Because this is a program-level EIR, this document does not evaluate the impacts of specific, individual developments that may be allowed under the General Plan. Future specific projects may require separate environmental review.

To determine whether the proposed project would have the potential to have a significant environmental effect related to **school services**, the Draft Environmental Impact Report (Draft EIR) being prepared for the proposed project applies the following standard of significance:

> *Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for school services?*

The purpose of the Draft EIR is to assess the project's potential impacts to various environmental issue areas and public service and utility agencies, including the City of Menlo Park's school facilities. The Draft EIR will also provide recommendations that may be necessary to reduce such potential impacts to "less-than-significant" levels.

Any assistance that you can provide with the following questions would be greatly appreciated:

1. What is the capacity of the schools that would serve Menlo Park, and what is the current enrollment? Does the School District currently exceed its student capacity? If so, by how much?

2. What are the student enrollment projections for the schools that would serve Menlo Park? Does the School District anticipate that enrollment will exceed capacity at any of the schools?

3. What are the student generation rates the District uses to determine enrollment projections?

4. Does the District assess development fees for new commercial and residential development? If so, what are the fees?

5. Are there any plans for new or expanded school facilities? If so, where, to what extent, and when are the expanded or new facilities expected to be commence?

6. Is there a teacher to student ratio or some other performance standard established that the District must maintain? If so, what are those standards and is the District currently meeting those standards?

7. Are there any other issues related to maintaining the adequacy and quality of school facilities? If so, please provide details.

8. Would the District need to construct new or expand existing facilities to accommodate the Project?

9. Please provide any current documents on school services in the City including background reports, policy documents, and facility plans that you think would help with preparing the environmental review analysis for impacts to school facilities as a result of the proposed project.

If you have any questions, please feel free to contact me at 510.848.3815.

Sincerely,

Ricky Caperton

Responses from Ravenswood City School District to Placeworks
Regarding Menlo Park General Plan Update

1. What is the capacity of the schools that would serve Menlo Park, and what is the current enrollment? Does the School District currently exceed its student capacity? If so, by how much?

Currently, all of the District's schools serve students residing in both the City of Menlo Park and the City of East Palo Alto as the District has provided parent choice regarding school of attendance for many years. Table 1.0 shows the current and planned future capacities of schools within the Ravenswood City School District. Beginning in 2015-16, the District began to implement neighborhood attendance area boundaries so over time it is planned that Belle Haven Elementary and Willow Oaks Elementary will both be PreK-5 schools that serve predominantly students residing in the City of Menlo Park based on the neighborhood boundaries. This process will take many years as the District is allowing students to matriculate from their current school. In other words, implementation does not require students who currently attend a district school that is outside of the attendance area to transfer to the school within their attendance area. Furthermore, the District makes allowances for siblings to attend schools outside of the their attendance area as well. Even with the preK-5 planned shift to neighborhood schools, there will be two significant enrollment practices that will continue to mix students residing in the two cities within the District's boundaries. The first is the Los Robles Dual Language Immersion Academy which will continue to be a school of choice for all district families. The second is the planned Comprehensive Middle School to be located at the current Cesar Chavez campus which is planned to house all middle school students residing in the district boundaries.

Taking into consideration the factors discussed above, it is important to evaluate District's capacity on a district-wide basis. Currently, the District utilizes temporary portable classrooms to help meet the enrollment demands. In evaluating the district's capacity district-wide without the portable classrooms, which are nearing the end of their useful life, the total district capacity is approximately 2,850. Currently, the District has enrollment of 3,291. The District addresses this current limited capacity in the permanent classroom buildings in its Facilities Master Plan which includes new classroom construction to house students currently located in temporary portable classrooms. Additionally, the proposed new construction that is outlined in the District's Facilities Master Plan includes classroom space for preschool and transitional kindergarten.

2. What are the student enrollment projections for the schools that would serve Menlo Park? Does the School District anticipate that enrollment will exceed capacity at any of the schools?

As described in the response to question number one above, students residing in Menlo Park will continue to attend schools located in East Palo Alto. In looking at the District's capacity across the district, enrollment will exceed capacity when the temporary current portables being utilized are beyond their useful life unless the District is able to construct new classrooms to meet this enrollment need.

3. What are the student generation rates the District uses to determine enrollment projections?

The District contracted with Davis Demographics and Planning to prepare a Student Population Projections Report. A link to the document can be found here: https://www.dropbox.com/s/taa4xa3dnkujp7x/Fall2013FinalReport%20copy.pdf?dl=0
The Student Yield Factor is described on page 8. The study uses "a 0.39 K-8 yield factor for single-family units and a 0.56 K-8 yield factor for multi-family units."

4. Does the District assess development fees for new commercial and residential development? If so, what are the fees?

Sequoia Union High School District administers assessment, collection, and distribution of development fees for Ravenswood and several other elementary school districts within the overlapping boundaries of the high school district. Fees are $3.36 per square foot for residential development and $0.54 per square foot for commercial development.

5. Are there any plans for new or expanded school facilities? If so, where, to what extent, and when are the expanded or new facilities expected to be commence?

Ravenswood school district facilities are in severe disrepair and temporary portable classrooms are utilized extensively in the District to help meet the demand for classroom space. To address these needs, the district conducted an extensive facilities assessment resulting in a comprehensive Facilities Master Plan. A link to this document can be found here:
https://www.dropbox.com/s/unbq0k0pmptnjst/RCSD%20Final%20Master%20Plan%20Report%202-5-15%20copy.pdf?dl=0

The projected cost of critical and educational program needs for school facilities alone exceeds $250 million. The District is currently in the process of determining priorities and creating a funding plan to begin the implementation of the Facilities Master Plan. At this time, there is no set timeline for the construction of new or expanded facilities.

6. Is there a teacher to student ratio or some other performance standard established that the District must maintain? If so, what are those standards and is the District currently meeting those standards?

The current standard for grades K-3 is 24 to 1 and for grades 4-8 is 31 to 1. Currently the District is meeting both of these standards.

7. Are there any other issues related to maintaining the adequacy and quality of school facilities? If so, please provide details.

As described above, Ravenswood school district facilities are in severe disrepair. Currently, all of the district's permanent buildings have roofs that are beyond their useful life and require annual patching to make it through the rainy season. There is an urgent need for approximately $7 million of roofing work. Additionally, there are extensive needs to replace heating systems and to improve ADA access at all schools district-wide. To address these needs, the district conducted an extensive facilities assessment resulting in a comprehensive Facilities Master Plan. The projected cost of critical and educational program needs for school facilities alone exceeds $250 million. The District is currently in the process of determining priorities and creating a funding plan to begin the implementation of the Facilities Master Plan.

8. Would the District need to construct new or expand existing facilities to accommodate the Project?

The student population projection study referenced above did not take into account the scale of growth described in the 2040 Buildout cited in the ConnectMenlo proposed General Plan updates. With the addition of the proposed 14,150 new residents and 9,900 new employees, we would anticipate a significant need for new and expanded school facilities.

9. Please provide any current documents on school services in the City including background reports, policy documents, and facility plans that you think would help with preparing the environmental review analysis for impacts to school facilities as a result of the proposed project.

October 20, 2015

Wael Saleh, Chief Business Official
Redwood City School District
750 Bradford Street
Redwood City, CA 94063

Re: School Services

Dear Wael Saleh:

The City of Menlo Park is currently updating the Land Use and Circulation Elements of the General Plan, which were last comprehensively updated in 1994. In addition, the City is updating the Bayfront Area Zoning ordinance. Collectively, the updates are referred to as ConnectMenlo. Both the General Plan Update and the Zoning Ordinance Update are summarized below, followed by Table 1, which is the existing and proposed 2040 Horizon-Year Buildout Projections. As shown in the table, the projected growth for the proposed ConnectMenlo Project for the 2040 horizon year, plus the Current General Plan development potential (but not including Facebook Campus Expansion), is 4.1 million square feet of non-residential space, 400 hotel rooms and 5,500 residential units, and up to 14,150 new residents and 9,900 employees.

General Plan Update

The proposed Land Use and Circulation Elements are intended to guide development and conservation in the city through the 2040 buildout horizon of this General Plan. These two elements are central components of the General Plan because they describe which land uses should be allowed in the city, where those land uses should be located, how those land uses may be accessed and connected, and how development of those uses should be managed so as to minimize impacts and maximize benefits to the city and its residents. The Land Use Element frames the type and scale of potential development that may occur over the next 24 years, particularly in the Bayfront Area. The Circulation Element addresses transportation issues throughout the city. Both updated Elements have been written to be consistent with the other General Plan Elements and the 2012 El Camino Real/Downtown Specific Plan.

Bayfront Area Zoning Ordinance Update

The Project includes an update to the City’s Zoning Ordinance for the Bayfront Area formerly referred to as the “M-2 General Industrial Zoning District”, including both development regulations and design standards, to ensure consistency with the General Plan Update and previously adopted ordinances and policies. The proposed Zoning Ordinance Update would create the following five new districts, which would apply to lands within the Bayfront Area: Light Industrial (I-L), Business Park (C-BP), Office/Tech/Research and Development (O), Life Sciences (LS), and Mixed Use Residential (R-MU). These districts are intended to foster innovation and emerging technologies; promote the creation of an employment district with travel patterns that

are oriented toward pedestrian, transit, and bicycle use; and provide amenities to surrounding neighborhoods and fiscal support to the City leveraged through development intensity bonuses. The standards for development within the LS and O districts allow increased development intensities with the provision of community amenities.

Placeworks – Menlo Park General Plan Update

1. **What is the capacity of the schools that would serve Menlo Park, and what is the current enrollment? Does the School District currently exceed its student capacity? If so, by how much?**
   One existing school serves Menlo Park (Menlo-Atherton High School).
   That school is building to expand its capacity. The school has approximately 2278 students and a capacity of 2250. Enrollment is growing approximately 50-75 students a year at the high school, which serves Atherton, East Palo Alto, and Menlo Park.

2. **What are the student enrollment projections for the schools that would serve Menlo Park? Does the School District anticipate that enrollment will exceed capacity at any of the schools?**
   a) The projections are based on recent enrollment studies completed by the School District.
   b) Enrollment will exceed capacity at Menlo-Atherton at points during the next five years. Ongoing construction, related to the District's Measure A bond program, is working to keep up with the enrollment growth by developing additional classrooms and facilities as the student population increases.

3. **What are the student generation rates the District uses to determine enrollment projections?**
   The District uses the State of California generation rate of 0.2 students per housing unit.

4. **Does the District assess development fees for the new commercial and residential development? If so, what are the fees?**
   The District assesses impact fees on commercial and residential development and collects on behalf of the eight elementary school districts within the Sequoia Union High School District (please see the attached document entitled "Developer Fee Schedule" for additional information on fees charged for this year).

5. **Are there any plans for new or expanded school facilities? If so, where, to what extent, and when are the expanded or new facilities expected to be commence?**
   Menlo-Atherton is in the midst of a campus-wide expansion.
   a) A 21 classroom building unit has broken ground (for a net addition of 10 classrooms).
   b) A 6 classroom lab building is in design (and could begin construction in winter of 2017).
   c) An expanded guidance office and other renovation work related to enrollment growth is also planned.
   d) The District is building a small high school (for approximately 400 students) in Menlo Park at 150 Jefferson Drive to accommodate enrollment growth.

6. **Is there a teacher to student ratio or some other performance standard established that the District must maintain? If so, what are those standards and is the District currently meting those standards?**
Contractually the District staffs at a 27.5 to 1 ratio for teachers. The District exceeds that staffing ratio currently (this is different from average class size).

7. **Are there any other issues related to maintaining the adequacy and quality of school facilities? If so, please provide details.**
There is six to ten million dollars of deferred maintenance items on the Menlo-Atherton campus presently, which is only partially funded.

8. **Would the District need to construct new or expand existing facilities to accommodate the Project?**
In the next twenty years, many of the campus classroom wings will come to the end of their useful life and will need to be replaced.
With a planned increase of 5430 residential units, the project will have a significant impact on Menlo-Atherton, which is the District's largest and most impacted high school in terms of enrollment.
This project could drive the high school beyond its projected enrollment of 2600 and cause over-crowding. None of the District's projections include these housing units (and the potential for high school aged children living in them). The District facility master plan for Menlo-Atherton High School does not allocate any construction dollars to the school to build for an enrollment beyond 2600. (In fact, six portable rooms are slated to remain on the campus in front of the aquatic facility to create capacity for the last part of the planned enrollment growth.)
In sum, this project will result in direct costs to build new facilities (classrooms, offices, athletic space, etc.) to the District.

9. **Please provide any current documents on school services in the City including background reports, policy documents, and facility plans that you think would help with preparing the environmental review analysis for impacts to school facilities as a result of the proposed project.**
Enrollment reports are attached, as is the most current Menlo-Atherton facility master plan.

- DRAFT FOR DISTRICT STAFF REVIEW ONLY -

Dear Superintendent and Board Members:

This is the concluding documentation to the forecast update. As in our last report, the sections below provide a summary of the findings and some background information. Subsequent sections follow the order of the tables, starting with the projected enrollments in Tables 1A and 1B and then the underlying factors to those numbers in Tables 2 to 4. The appendices provide additional details for those who want to delve further into the data.

Projections Summary

Total enrollment in the five Sequoia Union High School District (SUHSD) schools is forecast to rise by nearly 1,000 students in the next six years. The annual gains should be relatively modest at first, with projected growth by 101 to October 2015 and another 131 (232 total) to October 2016. The rate of increase then accelerates after 2016, with 741 more students added to 2020, for an average annual increase by 185 students in that four-year period. The result is a projected 2020 enrollment of just under 9,600, compared to the current total of 8,601.[1]

Our previous forecast had 482 more students in 2020, but there are now several reasons to expect less growth. One key factor is a shift to an enrollment decline in the Redwood City School District (Redwood CSD) region. Also contributing is an easing this year of what had been some unusually high “advancement” rates into and through the high school grades in the Carlmont part of the SUHSD. A third factor is that we no longer are including NPS and Community Day students in the projections.

The projected increase is again concentrated in the (pending) Carlmont region, but all four regular high schools should have some resident (home school) student growth occur in their attendance areas. Stating what those numbers will be has become more difficult because the pending attendance regions include “option” areas; for the sake of clarity in this summary, we are including those as part of the resident totals with the main schools for *the 2015-16 attendance areas (i.e., as if they existed today)*. The projected Carlmont population adds 40 in 2015 and a cumulative 533 to 2020, to a total of almost 2,400 students. Our previous forecast for this region was much higher because that had a section of East Palo Alto that we are now including in the Menlo-Atherton data instead. Nonetheless, if option area and Tinsley gains are allowed to continue to the same degree as currently exists in ninth grade, then the Carlmont enrollment could be in the upper 2,500s in 2020. Unique to this attendance area is an expectation of modest further growth in subsequent years. The next largest projected increase occurs in the Menlo-Atherton (M-A) attendance area, with 95 resident students added in 2015 and a cumulative rise by 240 to 2020. The result would be a resident total of essentially 2,800 students, but continued transfers to other schools and Redwood High should result in much lower enrollment numbers, including with less enrollment growth for

[1] “Current” refers to the enrollment as of October 1, 2014, in a modified student file provided to EPC by the SUHSD. Please note that whenever just a year is stated in the text, such as 2020, the reference is for October of that year.

next year. The pending Sequoia and Woodside regions have only modest resident differences projected over the next 72 months, with nominal declines by 14 and 18, respectively, in 2015 and net gains of around 100 each to 2020. Both of these areas could have consequential resident student reductions after 2020, but any figures for more than six years hence should be considered as simply general estimates rather then specific amounts.

Background Information

This section is repeated from our last report for the consideration of first-time readers. Our methodology is based on the use of numerous “planning areas”. In our original study for most client districts, we will drive every street to learn the community and divide it into suitable areas for trend analysis purposes. Each of those areas usually represents a single dominant housing type (wherever feasible) by subjective price ranges and average home and parcel sizes. We have found that even subtle differences in residential type and value can generate divergent enrollment trends in some districts.

This process was applied to varying degrees in the SUHSD region. Our first study for the SUHSD occurred in the 2011-12 school year. As with this study, the goal was neither short-term staffing decisions nor determining the enrollment impacts of potential new housing. Those goals require more refined projections with corresponding cost, especially in terms of the fieldwork required to establish numerous housing-category-specific planning areas. The SUHSD instead requested a lower cost, more generalized trend study suitable for evaluating the high school attendance areas and basic facility capacity needs. We already, however, had provided more in-depth studies for the Menlo Park City (MPCSD), Los Lomitas (LLSD) and Belmont – Redwood Shores (BRSSD) school districts with more refined planning areas and those were used for these SUHSD studies. We also provided some housing situation refinements in 2011-12 in the Redwood City (Redwood CSD) region because that was needed for sufficiently accurate projections in a crucial section of the SUHSD. The impacts of new housing developments such as that proposed next to Seaport Blvd. in Redwood City are excluded.

Projected SUHSD Students in Current Attendance Areas

This forecast is again based on analyses of where the students live (the resident population[2]) rather than the schools they happen to attend (the attending enrollment). Such analyses are important due to both across-attendance-boundary enrollments, including to Redwood continuation high, and incoming students from outside the SUHSD region. These intra- and inter-district contributions have blurred the ability to see many of the population shifts that are occurring in different sections of the community. By coding all of the student addresses from the current and several preceding school years to planning areas that represent various housing types and locations, we have been able to identify and evaluate how the student population is evolving in each situation. We flip back-and-forth between these "resident" and "enrollment" amounts in the text below and it is important to remember the distinction between these two types.

Complicating these “resident” identifications are the “option” areas for the boundaries that will be effective in the 2015-16 school year. New students in each location that was transferred to a different high school will have the option to choose to attend the previous school of assignment, if the District determines there is sufficient capacity available at that former school. Incoming ninth graders who graduated from a middle school via the “Tinsley” program also will have the option, if capacity permits, to attend the high school relevant to that middle school’s location. These “option” area and Tinsley-related choices for new students will have higher priority than other requests for intra-district attendance (i.e., across SUHSD attendance boundaries).

It is difficult to identify the long-term enrollment impacts of these attendance area shifts. The SUHSD already has extensive intra-district attendance for the current attendance areas and with all ongoing students “grandfathered” (continuing to be assigned) to their currently enrolled schools next year, most of that former intra-district flow will

[2] “Resident” throughout this report means physical resident, not legal resident.

still exist in 11-12. But the way that the District has allowed the current ninth grade intra-district attendance to occur in the pending option areas provides a good indication of how the enrollment at each school might evolve.

To deal with these changes, we are presenting the projected resident student numbers by two methods. The first, which is shown in Table 1A on page 4, ignores the option areas and Tinsley allowances in the resident totals. All net intra- and incoming inter-district amounts, regardless of reason or grade, are compiled into one attending adjustment number (which is explained below) for each regular high school. The second method extrapolates the current percentage choices in ninth grade from the option areas into the total projected resident 9-12 student populations. This more complex, but potentially more accurate, calculation underlies the numbers in Table 1B on page 5. The following subsection describes how to read the figures in these two tables.

Understanding the Data in Tables 1A and 1B

Tables 1A and 1B contain two data sets for each school. The figures on the left, under "Actual October 1, 2014", show the difference between the current enrollment and the relevant resident student population for each school *under the main 2015-16 school assignments*. Carlmont in Table 1A, for instance, had 2,185 enrolled students on October 1, 2014, which is 336 more than the SUHSD-enrolled resident total (for the pending main Carlmont area) of 1,849.[3] This difference is identified by the "336" in the top row of the column titled "Attend Adjust" (short for net attending adjustments between resident and enrollment amounts). In Table 1B, however, this adjustment amount is valid only for the exclusive area to each school, such as the "-84" for Carlmont from the "Carlmont Only Part".

The second set of data, on the right side of the tables, covers the projected resident amounts in specific years. These are not projected enrollments. They do indicate, however, the extent to which the current attending adjustments (for the pending boundaries) can continue. The resident total in Table 1A in the pending Carlmont region, for example, rises from 1,849 this year to 2,382 in 2020, which is a 533-student increase. That much higher total may alter the extent to which intra- and inter-district enrollment, currently a net +336, can continue. It should be noted that some of the latter figure is students from the East Palo Alto area that is in the Carlmont region this year, but will be assigned to M-A with a possible Carlmont option in 2015. Table 1B extrapolates the current option area percentages for ninth graders into resident ratios for each school in all grades. Again using Carlmont as an example, the projected resident total in 2020, if those percentages continue, is 2,573. This includes some students who will attend Redwood High instead. It also is prior to allowing any other non-option-area-related and non-Tinsley-related intra- and inter-district attendance.

For Carlmont alone, due to the amount of growth being projected, we also show in Table 1B what the totals would be, such as 2,356 in 2020, if just all of the Carlmont Only area students and 83% of the students in Carlmont with Sequoia Option area attend Carlmont. That 2,356 total could be reduced by 84 students in Carlmont attendance if no other incoming adjustments are allowed. The resident figures for the other schools, however, would be higher if this restriction (no secondary option area or Tinsley attendance) is implemented for Carlmont by 2020.

Key Findings Related to the Data in Table 1A: Current Resident-to-Attending Differences at Carlmont and M-A

As might be expected with these pending boundary changes and the current ninth graders who are enrolled as if those boundaries already exist, there are some significant net adjustment amounts. In particular, the pending Carlmont area has a current net gain of 336 and Menlo-Atherton has a net reduction by 395. The majority of those amounts are related to the pending "M-A with Carlmont Option" area that is now assigned to Carlmont, but from which this year's ninth graders were allowed to choose M-A instead. Once that school becomes the main assignment for all students from the Ravenswood CSD region, more of those students are likely to attend Menlo-Atherton. This should significantly reduce the net adjustment amounts for Carlmont and M-A accordingly.

[3] All current and forecast figures exclude high school NPS (non public school) and charter school students included in some State reports as part of the SUHSD enrollment. These have been removed at the request of the SUHSD. A small number of Independent Study students are included in these regular school enrollment and resident counts.

Key Findings Related to the Data in Table 1A: Projected Changes Overall and in the Main Attendance Areas

The total SUHSD enrollment (in grades 9-12, excluding NPS and charter school students) is projected to rise by 973 in six years, as is shown in the bottom right corner of Table 1A. The result is a forecast of 9,574 students in 2020. That compares to a current total of 8,601.

While there should be some growth in every year during that period, a faster rate of increase is forecast after 2016. The expected gain for next year is a relatively modest 101 additional students. Another 131 (232 total) are projected in 2016. The average during the following four years is by a more significant 185 additional students annually. This is due to some large student body classes now in the elementary districts that will be graduating into the SUHSD between 2016 and 2020.

Our previous forecast had an even higher total for 2020. There are several reasons for this 482-student difference, including (1) a moderately lower than expected SUHSD enrollment this year (i.e., less growth), (2) a declining enrollment in the Redwood City School District, which is the largest "feeder" district to the SUHSD, and (3) removal of NPS and Community Day students from the projections. Those 80+ students were included in the last forecast. We discuss each of these and the other key trend factors later in this report.

Despite this lower amount of projected growth, many of the resident change findings by the pending "main" attendance areas (with potential options ignored in the resident numbers) are in the same largest-to-smallest order as in our last study. For example, the M-A attendance area, despite significant changes to that region and the total number of resident students, still has the largest projected increase to 2016. Resident growth by 131 is forecast there in the next two years. The pending Carlmont region has the second highest gain with a rise by 103 students over the current count. The revised Sequoia and Woodside regions, by contrast, still have the smallest expected changes, with resident totals that stay within 40 of their present amounts for 2015 and 2016.

Table 1A: Actual SUHSD-Enrolled Resident and Attending Amounts in October 2014
and Projected Resident SUHSD-Enrolled Students (grades 9-12) for Totals in the Pending High School Attendance Areas*

	Actual October 1, 2014			Projected SUHSD-Enrolled October Resident Students

All Areas	**8,601**			**8,702**	**8,833**	**9,210**	**9,574**	9,024	**101**	**232**	**609**	**973**

* All resident figures are for next year's primary assigned school of each in-district address (i.e., ignoring possible options). These totals include SDC, Redwood High and Independent Study students but exclude NPS students, students enrolled in charter high schools, eighth graders taking SUHSD classes and adult education. (Previous forecast numbers included NPS and Community Day School students.) Small numbers of current elementary feeder district students who are listed at unlocatable addresses are included in the counts for the closest relevant high school once they reach the high school grades. The actual October 1, 2014, counts are based on student records provided to EPC by the SUHSD, *but are for the attendance areas effective at the start of the 2015-16 school year.*

** Net attending adjustments include intra-district and incoming inter-district students as if next year's attendance areas already existed.

Note: The projections contain hidden fractional amounts, so the rounded totals shown here may not exactly match those in other tables.

Note: See footnotes to Table 1A for explanation of this data and figures in Appendix A1 related to the percentages shown in this table.

After 2016, however, the subsequent growth shifts overwhelmingly into the Carlmont area. That region is forecast to add 430 SUHSD students between 2016 and 2020, to a total that is 533 above the current figure. The result is a forecast of nearly 2,400 students there. The M-A region, by contrast, adds only 109 more (240 total compared to the current count), but that nonetheless does create the largest resident total for any school, with nearly 2,800 students. Intra-district enrollment gain and losses for those two regions, while presumably becoming less significant, nonetheless could give those schools comparable total enrollments in 2020. While the Woodside region does add 130 during this period, that is after a projected decline by 36 to 2016, so the net six-year change is only 94 more students, to around 2,000. The Sequoia area has the smallest rise between 2016 and 2020, with 65 added (for 101 total from 2014), to essentially 2,300 students.

The final items deserving mention in Table 1A are the resident differences from 2020 to 2024. Numbers that far into the future should be considered only as general estimates, but it still is evident that Carlmont's region could have modest further growth while the other attendance areas should all have fewer resident students after 2020. These changes are based on the current counts and trends in the lowest elementary grades in each location.

Key Findings Related to the Data in Table 1B: Projected Pro-rated Resident Changes including the Option Areas

Table 1B is a more complex table than 1A, but it also could provide a better representation of how the resident numbers could evolve. This is because the figures in Table 1A, while much easier to comprehend, do not factor in how the pending option areas could impact the resident totals.

It is difficult to determine how those impacts will evolve, but we can get a good sense from the selections that the current ninth graders made. This is the first student body class that essentially had many of the option area choices available, especially for M-A. Table 1B shows what the resident results would be if the proportions of the ninth graders that choose to attend the schools in each option area this year evolves into similar shares in 9-12.[4]

If these current distribution patterns in ninth do represent the choices that will occur in 2020, then the proportionate resident numbers for M-A drop while those for the other schools increase. Carlmont could have the largest modified resident number that year, with 2,573 students. Menlo-Atherton's modified projected 2020 total is 2,515, or 281 less than the amount in Table 1A. Sequoia and Woodside have 34 and 49 more resident students, respectively, than in 1A. These figures are if all option- and Tinsley-related choices (at the current ratios in ninth) are permitted, but no other intra-district and incoming inter-district amounts are included (through open enrollment). Attendance at Redwood High will lower these amounts somewhat for the school enrollments.

Underlying Factors to the Projections: Recent Student Population Evolution

The student trends have shifted in many locations since 2010. In most of the SUHSD's feeder district regions, these adjustments were in one of the following three manners: (1) the degree of student increase slowed, (2) a swing from growth to decline or (3) a more rapid rate of reduction. All three of these differences had the same result of lower current student numbers than the trends prior to 2013 had suggested. These adjustments are shown in Table 2 on pages 8-10.

Understanding the Data in Table 2

Table 2 contains the resident counts in the six largest feeder districts (in total enrollments) for the students who were enrolled in any of those districts or the SUHSD in the last four years. The Portola Valley and Woodside SD regions are excluded because we do not have sufficient student data by home address from those districts, but

[4] To convert these proportions into resident shares for just the two schools relevant to each option area, we had to pro-rate those percentages (i.e., the students can be resident to only the two schools involved in each case). Appendix A1 shows the actual student numbers, percentages and pro-rating of those percentages that resulted in the percentages shown in Table 1B.

these areas are relatively modest contributors to the SUHSD enrollment. Totals are shown in the four-grade groups of 1-4 (first through fourth), 5-8 and 9-12, along with by individual grades in fifth through ninth. Those grade groupings allow a comparison between the amounts that are currently in the SUHSD grades and what will be graduating into those grades for four and eight years hence. They also indicate the degree that those groups will become larger or smaller as they graduate upward. In the case of the Belmont – Redwood Shores School District (BRSSD) area, for example, the 1,519 students in grades 1-4 in 2010 evolved into 1,600 students in 5-8 this year (a gain of 81; see the top section on the first page of Table 2). That also resulted in over 300 more students in 5-8 today (that 1,600 total) than in 2010 (1,296). This suggests that there could be 300 more high school students in four years, compared to the current amount (1,339), if the same rate of growth occurs in the graduation from 5-8 to 9-12.

Also shown in Table 2 is how the average annual rate of change between 2010 and 2013 compares to what happened between just 2013 and 2014. Again using the BRRSD region as an example, the rate of increase in the 1-4 group eased from 64 annually, on average, to 33 in the last year. Nonetheless, that continued the growth of recent years, which we had projected would be ending (as is shown in the bottom row of the BRSSD section, with 27 more students than projected[5]).

These grade-group changes also correspond to differences in the sizes of the incoming and outgoing classes in each group, but the advancement ("graduation into") rates deal with the same student body classes, so those can be a better indicator of true gains and losses. We focus in this table on those advancement changes from fifth to sixth and eighth to ninth because those are the grade-level changes in most districts, when the biggest population shifts often occur. In the BRSSD region, the number of public school eighth graders in one year had averaged an increase by eight students enrolled in ninth in the SUHSD a year later. This year, however, there was instead a net loss of 15 students in that advancement. This 23-student difference was the main reason that the forecast was high by 19 students in that grade.

Key Findings Related to the Data in Table 2

Three locations had noteworthy shifts in the latest years, compared to the trends over the previous years. One of these is the sudden drop-off for growth at the high school level in the BRSSD region. As is discussed in the following main (bolder header) section, that region had some unusually high grade-to-grade "advancement" rates (a.k.a., "cohort survival" rates) into and through grades 9-12. Applying such previous rates to the larger classes graduating into the SUHSD, versus those graduating out, had justified projecting a much larger current 9-12 total in the BRSSD area. Those rates eased in 2014, which caused the 9-12 forecast to be high by 45 this year, which was the main divergence at the high school level. We had projected those rates would come down, but not this quickly. The new averaged rates, including the last year of change, thus are more realistic to be ongoing and we have applied them to the updated forecast. This 9-12 trend shift in the BRSSD area thus is not a concern to us.

The second notable shift occurred in the grades 1-4 group in the San Carlos SD region. That area added 134 students in these grades between 2010 and 2011 and much smaller amounts in the next two years, but there was still growth occurring. Instead of rising by another 15 students, as had been projected, the current 1-4 total fell by 37, for a significant 52-student difference. Otherwise the forecast in this area, for the remaining grades, was statistically accurate, so this lowest-grades drop is a factor for the high school forecast only after 2018. The 9-12 projections in 2020 are now moderately lower accordingly.

The third location with significant trend adjustments is in the Redwood City SD area. These are both the most consequential differences for the forecast and the least understood. The counts in grades 1-4 rose by 108 from 2010 to 2011, which continued a growth trend from prior years (not shown in this table), but fell by 367 since then.

[5] The projected amounts shown in Table 2 are after removing NPS and Community Day students from the original forecast numbers. The former is being removed from the data this year at the request of the District. The latter program has been shifted to the San Mateo County Office of Education.

* Figures cover all students in the grades shown, other than SUHSD charter and NPS students, enrolled in the SUHSD and six largest elementary feeder districts (all but Portola Valley and Woodside districts, for which insufficient student home address data is available).

** Projected figures from 2013-14 are after removing SUHSD NPS and Community Day School students from the 2013-14 base data.

*** All Ravenswood CSD region figures, including projected amounts, are after removing students attending PVSD and WSD schools.

Table 2, page 3 of 3

The loss in the last year in grades 1-4 was especially significant, at -175 students. Equally concerning are the large reductions in the classes graduating into sixth and ninth. The previous average in the classes advancing from fifth to sixth was a net decline by 31, but more than twice that amount, or -65, left that region in 2014. The average advancement from eighth to ninth had been a drop by 42, but there are 107 fewer for the current ninth. That is two-and-a-half times as much. These are huge statistical shifts that were the most problematic sources of the deviation between the projected and actual 2014 amounts in the SUHSD region.

Table 3 below shows how severely the overall direction changed here for all students enrolled in the Redwood City SD. After three years of significant growth (from 2008 to 2011), there was a drop by 69 in 2012 and then much larger reductions by 185 and 160 (345 total) in the last two years.

The three remaining largest feeder regions, in student numbers, generally were accurately projected for this year, other than the inevitable offsetting nuances in a few grades. The Ravenswood City SD region, including "Tinsley" students attending the other districts listed, deviated by only three students in the 1-8 total and eight students in 9-12. Both the Menlo Park City and Las Lomitas SD regions have within one student of the projected 1-8 totals. Only the greater-than-expected drop entering ninth in the latter is a meaningful difference for the SUHSD, as continuing that, which is only partially projected, would have a larger cumulative impact on all of grades 9-12.

Table 3: Redwood City School District Total Enrollment by School in the Student Files Provided

Total October TK-8 Enrollment 2008	2009	2010	2011	2012	2013	2014	Enrollment Difference in One Year to October of 2009	2010	2011	2012	2013	2014
							201	72	162	-69	-185	-160

Notes: Figures cover all Redwood City SD TK-8 students in the files provided. Decline since 2012 would be slightly larger without NPS.

Average Student Grade-to-Grade Advancement Rates

The following explanation is mostly repeated from our last report. Readers who already understand how to interpret advancement rates can go to the subsection titled *“Key Findings Related to the Data in Table 4”* (below).

Grade-to-grade “advancement” rates are calculations of the change in the number of students in each grade as they graduate into the next grade. Usually such rates are averaged over the last several years within each single-grade advancement to avoid giving too much influence to nuances that may have occurred in any one year. These rates are then evaluated for their likelihood to continue, by degree, through the forecast period.

For this study, varying levels of rate determination again have occurred. The most in-depth rate refinements by housing situation are in the BRSSD, MPCSD and LLSD regions.[6] Some housing-situation refinement also has been made for these calculations within the Redwood CSD region. Simpler aggregations have been made in the remaining feeder district parts of the SUHSD.

Understanding the Data in Table 4

The latest average advancement rates entering each high school grade are shown on the right side of Table 4 on pages 12 and 13. In the “Modest, Moderate and Hillside Mixed Value” SFD (single family detached) housing group in the BRSSD region, for instance, the "1.04” rate entering ninth grade for “This Study” means that, on average since 2011, a net of 104% of the eighth grade population in one year became ninth graders a year later from the same neighborhoods. That is a nominal reduction from the 1.05 rate determined in our last study.

The cumulative rates shown in the middle section of Table 4 are the result of a compounding of the individual grade-to-grade rates from kindergarten to eighth. These figures show what the net aggregate change would be, if these rates continue, as each group of kindergartners graduates upward through all of the elementary grades. Again using the “Modest, Moderate and Hillside Mixed Value” SFD group within the BRSSD as an example, the “1.23” for the latest period (2011 to 2014) means that 100 students in kindergarten in one year would become 123 students eight years later in eighth grade (i.e., a 23% increase). These cumulative figures are a good indication of the net effect that (1) families moving in and out of the districts and (2) students transferring between regular, charter and private schools are having on the K-8 enrollments and the subsequent high school populations.

We have boxed in the table the rates that changed by at least 5% since the last calculation, which is significant, especially in larger student numbers (800+), when one realizes that two-thirds of the current and prior calculations cover the same years of change (i.e., from 2011 to 2012 and 2012 to 2013). The purpose of this boxing is to highlight situations where the student population trends changed the most dramatically in the latest calculation.

Also applied, in the version of this report printed in color, is color highlighting for those rate shifts by at least 5% since our last study. Yellow represents gains of at least 5% in the cumulative rates and/or the rates into ninth, while orange represents losses of at least 5% in those rates.

While these rates can seem statistically abstract, they are a critical forecast component.

Key Findings Related to the Data in Table 4

To repeat from our past reports: There are huge differences in these rates, with big student gains occurring in some locations and major losses, especially entering ninth, happening in other situations. All but one of the cumulative rates shown in Carlmont’s BRSSD and SCSD regions are above 1.00 and that is on top of having had

[6] The elementary data shown for those districts in Table 4, however, covers students from most of the SUHSD region (i.e., those enrolled in the BRSSD, SCSD, Redwood CSD, Ravenswood CSD, MPCSD and LLSD) for each location listed. This creates modest differences from the totals shown for the same situations in our reports for those feeder districts.

* Students listed at addresses in the relevant locations and attending any BRSSD, SCSD, Redwood CSD, Ravenswood CSD, MPCSD, LLSD or SUHSD school, except that (1) SUHSD NPS students are excluded, (2) charters in all but Redwood CSD are excluded and (3) the rate entering ninth grade for the combined PVSD and WSD students is available from 2013 to 2014 only. 100% (1.00) rates were applied in the lower grades in these two regions. "SFD" covers single-family detached homes and "ATT" is for attached units (apartments, condos, townhouses and plexes). "Mix" is for areas with a mix of SFD and ATT.

** These cumulative rates are the cumulative impact from kindergarten to eighth grade of the individual grade-to-grade net "advancement rates" (a.k.a. "cohort survival rates") averaged over the relevant three-year period. The LLSD's SFD homes, for example, collectively had net average grade-to-grade advancement rates between Oct. 2011 and Oct. 2014 that combine into a 0.91 cumulative rate. This means that, if these rates continue, there eventually would be 91% as many eighth graders (i.e., a 9% reduction) from these same housing units as there had been kindergartners eight years earlier.

*** These categories have fewer than 800 students (K-12), for which such small numbers allow greater rate swings.

**** Totals for the pending Carlmont portion of the SCSD includes the "Carlmont with Sequoia Option" areas.

Notes: (1) Figures exclude both inter-district students from outside the SUHSD region and a small number of students listed at home addresses (or no address) that could not be assigned. (2) Advancement rates shown are the actual calculated rates. These have been modified where warranted in the forecast. (3) See Appendix B for more information.

Table 4, page 2 of 2

some large kindergarten populations (i.e., the numbers are higher in kindergarten and then getting even larger as each of those student body classes graduates upward). There is a further student increase as each class entered ninth in most of these categories.

What is different in the BRSSD region in this update, compared to our previous calculations, is that while three of the cumulative rates rose by statistically huge degrees, many of the rates into and through the high school grades fell. Four of the five housing categories there, including those with the three largest student populations, have lower rates entering ninth this year than last. While all four of those categories still have advancement rates into ninth that are above 1.00 (100%), these are not by as great an extent as before. Only the one category that had a rate into ninth that was well below 1.00 bucked this trend, and that is in a relatively small student population (876 K-12 students). Not shown in this table is that some of the over-1.00 rates through the high school grades also came down. The rates entering twelfth in the two BRSSD categories with the largest student counts, for example, had been 1.05. They now are 1.03 and 1.02. And the rate entering eleventh from “Relatively Affordable” ATT units (with ATT being the abbreviation for attached, which covers apartments, condos, townhouses and plexes) had been an unsustainable 1.14 (i.e., a short-term anomaly) that dropped to 1.07 in this update. All of these updated high school rates in the BRSSD region are more realistic to be approximately ongoing over the next decade. The degrees that many of the cumulative rates in this area exceed 1.00, by contrast, are unlikely to be maintained. Some of the underlying grade-to-grade rates have been moderated accordingly, including via the alternative four-year averages shown in Appendix B2.

Partly offsetting these higher cumulative rates, in terms of the subsequent impact on Carlmont, was a meaningful reduction in the cumulative rate from the SCSD part of Carlmont's attendance area. That figure declined from 1.15 to 1.04 in a significant student population (1,912 in K-12).

The region with the most problematic shifts, for the forecast, is the Redwood City SD. Other than some aberrant figures in the very small MHP student population (just 354 students), all of these cumulative rates are well under 1.00. For the general housing categories with the two largest populations (3,731 and 2,822 students), the rates fell by 9% and 8%, to just 0.74 and 0.72. Those are huge statistical reductions in such large student numbers, with the latest cumulative rates being far below the norm. These housing categories also now have lower rates entering ninth, at 0.83 and 0.91. The former, in particular, is in a lower cost dwelling group that should not be having significant percentages going to private high schools, so having one in every six students, in net, not graduate into the SUHSD in ninth does not make sense.

We do not have a good understanding of why the trends in this region, unlike the other feeder district areas with a broad range of housing values, have shifted so severely in the latest years. The jump in local housing rents and prices probably factors into this, but why that would be so much more evident here than in the BRRSD, SCSD, Ravenswood City SD or MPCSD regions is unknown. We have modified some of these rates in the Redwood CSD region accordingly in the forecast, including via the alternative four-year averages shown in Appendix B4. There is, nonetheless, a wide range in how the student numbers could evolve in the Redwood CSD area.

Not changing significantly are the low rates entering ninth from the southeastern and southernmost parts of the SUHSD. To repeat from our last report, we do not recall having calculated such declines entering ninth from sufficiently large student populations in any other district. This finding overwhelms everything else being determined in these sections of the SUHSD. The three largest housing categories in the MPCSD region have updated rates entering ninth of 0.90, 0.78 and, in the more expensive SFD places, just 0.73, for a net 27% loss. The SFD homes in the LLSD region have a 0.77 rate entering ninth, for a net 23% loss. These effectively are all in the current Menlo-Atherton attendance region.

The concern for the forecast is that these particular rates entering ninth, most of which have risen since our first SUHSD study, have the potential to become much higher (i.e., not as far below 1.00). That would give M-A and even larger 2020 resident total than we currently can justify projecting.

The final rate that should be discussed is the 0.84 figure entering ninth in the Ravenswood CSD region. That is well under 1.00 because many students there attend the East Palo Alto (Aspire) Academy, which is not included in these student counts and rates.

Concluding Commentary

There is no assurance that the current school choices of ninth graders in the pending option areas will translate into similar ratios in the future, but that is the best "call" we can make today. In those areas, higher ratios of this year's ninth graders choose the currently assigned schools than we had expected, particularly from East Palo Alto. Nonetheless, large numbers of students in the pending option areas selected the future main schools rather than the current officially assigned schools. We believe this was the District's intent in creating the option areas, with some students going to each of the available choices. Having this pattern continue with future ninth graders will help maintain diversity at all four regular high schools.

* Resident students are those listed at home addresses within the specified area, regardless of the school they attend (among the school districts listed). The only charter school students included are from the charters in the Redwood City SD.

Notes: (1) Changes are over four years for groupings of four grades, with 1-4 compared to the prior 1-4, 5-8 to the prior 1-4, 9-12 to the prior 5-8 and 1-12 to the prior 1-12. (2) Transitional Kindergarten (TK) and Kindergarten (K) are excluded from this data. (3) Totals by elementary district regions may differ slightly between this and other tables because some student addresses could not be precisely located, such as by a housing type, but were assignable by larger areas such as high school attendance areas. (4) Totals do not add up to aggregate 1-12 enrollments of all relevant districts because a few completely unassignable addresses are excluded from this data.

* All Ravenswood CSD regional counts exclude any students from the 25 townhouses in the "Pacific Parc" complex that was transferred to the MPCSD on 7/1/12. Projected numbers from this region include estimates of the PVSD- and WSD-enrolled contributions.

** PVSD enrollment in Oct. 2012 contained 46 Tinsley students in a total of 672 students. Combined PVSD and WSD enrollment in Oct. 2013 contained 89 Tinsley students. PVSD enrollment in Oct. 2014 had 55 Tinsley students in a total of 623 students. No other Tinsley components of those school districts' enrollments were determined.

Notes: (1) Student counts are from combination of BRSSD, SCSD, Redwood CSD, Ravenswood CSD, MPCSD, LLSD and SUHSD files (other than in the merged PVSD-WSD region, within which the counts are from only those districts and the SUHSD). (2) Final year of change is weighted by 150% in the four-year change rates.

Low Point in Range of Equally Possible Totals in 2020 (essentially -2%) *9,380*
High Point in Range of Equally Possible Totals in 2020 (essentially +2%) *9,770*

*Realistic Maximum Potential Lower Total in 2020 (essentially -5% over six years)**** *9,100*
*Realistic Maximum Potential Higher Total in 2020 (essentially +5% over six years)**** *10,050*

* All resident figures are for next year's primary assigned school of each in-district address (i.e., ignoring possible options). These totals include SDC, Redwood High and Independent Study students but exclude NPS students, students enrolled in charter high schools, eighth graders taking SUHSD classes and adult education. (Previous forecast numbers included NPS and Community Day School students.) Small numbers of current elementary feeder district students who are listed at unlocatable addresses are included in the counts for the closest relevant high school once they reach the high school grades. The actual October 1, 2014, counts are based on student records provided to EPC by the SUHSD, *but are for the attendance areas effective at the start of the 2015-16 school year.*

** Net attending adjustments include intra-district and incoming inter-district students as if next year's attendance areas already existed.

*** These realistic maximum potential range numbers are for currently operating facilities and programs (including at local charter and private schools), with the range covering essentially an 80% probability. Under these assumptions, there are approximately 10% possibilities for each of even lower or higher numbers than the range shown. Socio-economic shifts factor into these possibilities.

Note: The projections contain hidden fractional amounts, so the rounded totals shown here may not exactly match those in other tables.

Redwood City, CA 94062-1098

December 3, 2013

Dear Superintendent and Board Members:

This is the concluding documentation to the enrollment forecast update. The sections below provide a summary of the findings and some background information. Subsequent sections follow the order of the tables, starting with the projected enrollments in Table 1 and then the underlying factors to those numbers in Tables 2 and 3. The appendices provide additional details for those who want to delve further into the data.

<u>Projections Summary</u>

Enrollment in the Sequoia Union High School District (SUHSD), aside from that in adult ed. and charter schools, is forecast to rise by over 1,500 students in the next seven years. This includes a gain of 273 students from the "current" (October 2013) 8,521 students to 8,794 for October 2014. The annual rate of projected increase slows slightly in the following 24 months, but another 309 are still added, to a total that exceeds today's figure by 582. The pace then accelerates from 2016 to 2020, with growth by nearly 1,000 more, to an enrollment above 10,000. That would be greater than 1,500 above the current count.[1]

This increase will be concentrated in the Carlmont High attendance area, but all four regular high schools should have resident (home school) student growth occur in their current attendance areas. The projected Carlmont resident population (grades 9-12) adds 85 next year and essentially 600 to 2020, to a total in the upper 2,800s. Nearly 600 of those are forecast from the East Palo Alto portion of that attendance area, but it should be noted that 58% of the current students from that area do not attend Carlmont. The next largest projected increase occurs in the current Menlo-Atherton attendance area, with 80 more resident students in 2014 and a cumulative rise by nearly 400 to 2020. The result would be a resident total above 2,500. Also forecast to reach the 2,500 vicinity, with a gain of close to 300, is the 2020 resident figure for Sequoia High. The lowest amount of growth is projected in the current Woodside High region, with only 35 added in 2014 and 238 to 2020, when the resident count could be close to 2,100.

There is significant intra-district (across attendance boundaries) enrollment in the SUHSD, along with to special schools such as Redwood. Continuing that will create enrollments that differ from the projected resident counts.

Due to nuances now occurring in the lowest grades of the elementary "feeder" districts to the SUHSD, the projected 2020 total of 10,056 SUHSD students could be the maximum achieved in the next decade.

[1] "Today" and "current" refer to the enrollment as of October 2, 2013, in the student file provided to EPC by the SUHSD. This file included enrollment in special schools such as Redwood and Community Day but excluded adult ed. and independent charter schools listed in some State reports as part of the SUHSD enrollment. The projections have been generated in grades 9-12 for those same non-charter populations. It also should be noted that whenever just a year is stated in the text, such as 2020, the reference is for October of that year.

Background Information

Our methodology is based on the use of numerous “planning areas”. In our original study for most client districts, we will drive every street to learn the community and divide it into suitable areas for trend analysis purposes. Each of those areas usually represents a single dominant housing type (wherever feasible) by subjective price ranges and average home and parcel sizes. We have found that even subtle differences in residential type and value can generate divergent enrollment trends in some districts.

This process was applied to varying degrees in the SUHSD region. Our first study for the SUHSD occurred in the 2011-12 school year. As with this study, the goal was neither short-term staffing decisions nor determining the enrollment impacts of potential new housing. Those goals require more refined projections with corresponding cost, especially in terms of the fieldwork required to establish numerous housing-category-specific planning areas. The SUHSD instead requested a lower cost, more generalized trend study suitable for evaluating the high school attendance areas and basic facility capacity needs. We already, however, had provided more in-depth studies for the Menlo Park City (MPCSD), Los Lomitas (LLSD) and Belmont – Redwood Shores (BRSSD) school districts with more refined planned areas and those were used for these SUHSD studies. We also provided some housing situation refinements in 2011-12 in the Redwood City (Redwood CSD) region because that was needed for sufficiently accurate projections in a crucial section of the SUHSD. The impacts of new housing developments such as that proposed next to Seaport Blvd. in Redwood City were not included.

Projected SUHSD Students in Current Attendance Areas

This forecast is based on analyses of where the students live (the resident population[2]) rather than the schools they happen to attend (the attending enrollment). Such analyses are important due to both across-attendance-boundary enrollment, including to special schools such as Redwood, and incoming students from outside the SUHSD region. These intra- and inter-district contributions have blurred the ability to see many of the population shifts that are occurring in different sections of the community. By coding all of the student addresses from the current and several preceding school years to planning areas that represent various housing types and locations, we have been able to identify and evaluate how the student population is evolving in each situation. We flip back-and-forth between these "resident" and "enrollment" amounts in the text below and it is important to remember the distinction between these two types.

Table 1, on page 3, provides summaries of both (1) the current resident and enrollment differences and (2) the projected resident numbers. The following subsection describes how to read these figures.

Understanding the Data in Table 1

Table 1 contains two data sets for each school. The figures on the left, under “Actual October 2, 2013”, show the difference between the current enrollment and the relevant resident student population for each school. Carlmont High, for instance, had 2,200 enrolled students on October 2, 2013, which is 70 less than the SUHSD-enrolled resident population (in 9-12) of 2,270 students. This difference is identified by the “-70” in the top row of the column titled “Attend Adjust” (short for net attending adjustments between resident and enrollment amounts).

The second set of data, on the right side of the table, covers the projected resident amounts in specific years. These are not projected enrollments. They do indicate, however, the extent to which the current attendance areas might continue to be suitable without any revisions. The resident total in the current Carlmont region, for example, rises from 2,270 this year to 2,869 in 2020, which is a 599-student increase. This is shown in the far right column of the table.

[2] “Resident” throughout this report means physical resident, not legal resident.

Table 1: Actual SUHSD-Enrolled Resident and Attending Amounts in October 2013 and Projected Resident SUHSD-Enrolled Students (grades 9-12) for Current High School Attendance Areas

School	Actual October 2, 2013* Resident Students	Attend Adjust**	Attending Enrollment	Projected SUHSD-Enrolled 9-12 October Resident Students (including SDC and NPS; excluding charter school enrollments) Total Students 2014	2016	2018	2020	Change from 2013 2014	2016	2018	2020

SUHSD Total	8,466	55	8,521	8,734	9,043	9,526	9,996	268	577	1,060	1,530
Incoming Inter-District Attend.	55	-55	(NA)	60	60	60	60	5	5	5	5
All Areas	**8,521**			**8,794**	**9,103**	**9,586**	**10,056**	**273**	**582**	**1,065**	**1,535**

* The actual student counts in grades 9-12 are based on student records provided to EPC by SUHSD (including SDC and NPS but excl. those enrolled in the Aspire EPA Phoenix Academy, Summit Preparatory, Everest and Stanford New charter schools).

** Net attending adjustments include intra-district and incoming inter-district students.

*** Some (non-charter) students in East Palo Alto parts of Carlmont and Woodside High attendance areas currently attend M-A.

**** CHS currently enrolls 278 from SHS region, 66 from WHS region, 24 from MAHS region and 14 inter-district/unlocatable.

***** WHS currently enrolls 296 from SHS region, 130 from MAHS region, 98 from CHS region and 19 inter-district/unlocatable.

Notes: (1) Small numbers of students listed at unlocatable addresses are included in the counts for the closest relevant high school. (2) All resident figures include NPS and Independent Study students and the students enrolled in any special schools other than charters. (3) Enrollments could be stable or slightly declining for several years after 2020 due to shifts occuring in the kindergarten eligibility birthdate cutoff (evolving from December 2 to September 1) which results in three adjacent student body classes containing essentially only eleven months of births. Those classes start to reach the high school grades in 2021-22.

Key Findings Related to the Data in Table 1: Current Resident-to-Attending Differences

The current attendance areas do not correlate closely to actual attendance in some situations. This is particularly true for the East Palo Alto (EPA) areas that are assigned to Carlmont and Woodside, as well as for Woodside in general. Carlmont's "EPA area" has 629 SUHSD students, but only 266 (42%) currently attend that school. The Woodside High "EPA area" has only 167 out of 271 (62%) attending the home school. The rest of the Woodside attendance area, which we refer to as the "core area" because it surrounds that campus, also has little to do with attendance. Of the 1,600 resident students in that "core area", only 1,072 (67%) attend Woodside. The other 528 are enrolled elsewhere in the SUHSD, but those are almost perfectly offset by 543 enrolled at Woodside (30% of the total enrollment there) from outside of that attendance area.

It is important to remember these resident-to-attending differences as the District considers any attendance area shifts (to deal with the projected student increase). Some shifts could follow what is now occurring in attendance, with the majority of the students in those neighborhoods already attending the newly assigned school. Other shifts may not move many students from the school intended to be relieved unless attendance area enrollment is more firmly enforced (i.e., future students in the shifted neighborhoods generally would not be allowed to attend the former home school).

Also realize that all resident totals will at least slightly overstate the probable future enrollments, even with strict attendance area enforcement. The reason is that some of those resident students will be enrolled in the special schools of Redwood, Community, Independent Study and "NPS" (for non-public-school students, but with some connection to the SUHSD for enrollment tracking purposes).

Key Findings Related to the Data in Table 1: Projected Resident Changes in the Existing Attendance Areas

The SUHSD enrollment should rise at a significant rate over the next seven years, resulting in a projected gain of more than 1,500 additional students to 2020. This includes an increase by 273 in 2014. A slower growth rate is expected for the SUHSD enrollment in the following two years, but that 582-student increase during the next 36 months still raises the district total to essentially 9,100 in 2016. The current enrollment, by comparison, is 8,521.[3]

Due to both (1) the current resident student distributions through all of the grades (TK-12, with TK explained later) and (2) improved graduation rates into ninth from the relevant districts, the largest increase to 2016 (in 9-12) should occur in the current Menlo-Atherton region. That attendance area is projected to have 195 more resident students in three years. The current Carlmont region is a close second with 179 additional resident students projected. The current Sequoia and Woodside areas are forecast for only 125 and 78 more resident students, respectively, to 2016.

The resident growth after then, however, should be concentrated in the Carlmont region. That attendance area is projected to add over 400 more students between 2016 and 2020; none of the other school totals rise by even an additional 200 during that time.[4] The resultant projected resident totals in 2020 are in the upper 2,800s for Carlmont, close to 2,500 for both Sequoia and Menlo-Atherton and only around 2,100 for Woodside.

We should note, however, that intra-district enrollment patterns will alter these resident numbers. The SUHSD has just adopted a new policy specifically allowing any EPA students to attend Menlo-Atherton, if space permits, even if they reside in the Woodside- or Carlmont-assigned sections of that community. This should create more intra-attendance into Menlo-Atherton and out of Carlmont and Woodside. The extent of those transfers could depend, in part, on factors such as (1) the degree that busing continues to conveniently occur to the latter schools and (2) any differences in the perceived educational quality at the various facilities (such as from "API" scores). Nonetheless, Menlo-Atherton could have a higher enrollment than Carlmont in 2020 (for the current attendance areas) with this new policy, especially if combined with other limits placed on intra-district attendance at Carlmont.

The total enrollment is projected to reach 10,056 in seven years, or 1,535 above the current figure, to what could be the maximum reached in the next decade. There are nuances in the lowest feeder district grades today that suggest a slight SUHSD enrollment decline after 2020 (as is discussed on page 10).

Underlying Factors to the Projections: Recent Student Population Evolution

The short-term enrollment trends determined in the previous study had two key issues. The first came from four of the elementary districts, namely the BRSSD, San Carlos (SCSD), MPCSD and LLSD, having had dramatic enrollment growth. As we noted in that study's report, your feeder districts, in aggregate, added more than 1,800

[3] These SUHSD totals are shown in the bottom row of Table 1 on page 3.

[4] All current attendance areas are projected to add more than 200 resident SUHSD-enrolled students between 2013 and 2020. These smaller amounts are for the portions of the growth occurring after 2016.

resident students (K-8) in the preceding three years, with most of that growth occurring in those four districts. The SUHSD total had risen by only slightly over 200 during that time. It was evident that the SUHSD's total would increase more rapidly once those larger by-grade totals in the feeder districts started graduating into ninth; the first key issue thus was by how much. Partly counteracting that finding was the second key issue of low net graduation rates from eighth to ninth in several situations. This had occurred to significant degrees in the Ravenswood City (Ravenswood CSD), MPCSD, LLSD, Woodside (WSD) and Portola Valley (PVSD) regions. The combination of these two key findings was a clear indication that the subsequent SUHSD enrollment growth would be most significant in the current Carlmont High attendance area, but there also was significant upside potential for the Menlo-Atherton and Woodside High resident numbers if those graduation rates into ninth became much higher. Our main concern then was that the limited period for which the student home-address trend data was available (by just three years of change for most districts and only one year of change for the Ravenswood CSD) might be exaggerating these findings.

We now know, with two additional years of student data by their home address locations, that most of those findings were not anomalies specific to that 2008-to-2011 period. The BRSSD, in particular, has continued to have tremendous student growth. As expected, some of those larger resident numbers have started to graduate into Carlmont. Student gains elsewhere in the elementary grades generally have slowed and in a few cases, such as in the Ravenswood CSD, there instead has been ongoing (modest) enrollment decline. Some of the unusually low rates entering ninth have risen moderately, but others have had minimal or no change. The result is that these updated projection numbers are higher for the current Carlmont attendance area but otherwise are close to the previous forecast estimates.

These latest locational trend differences are summarized in Table 2 (see page 6). As is shown in the far right column of that table, the previously mentioned Carlmont "core area" (labeled "All but Ravenswood CSD part" in Table 2) added 525 resident elementary (TK-8) and 279 resident SUHSD students since 2010. These amounts are over 50% of the total increase in those grade levels for the entire SUHSD region. The next highest gains were in the non-Ravenswood-CSD part of the Menlo-Atherton attendance area, with 299 more in TK-8 and 122 more in 9-12. The Sequoia, Woodside and Ravenswood CSD areas, by contrast, had little change in those resident totals, with each being within 100 students of the prior counts.

There also is now a significant range in the TK-8 totals for the four current SUHSD attendance areas. Menlo-Atherton has the most, with 6,748. Woodside has the least with 5,486, or 19% fewer students in TK-8. Both of those attendance areas have sections with notable resident student reductions in the graduation from eighth to ninth (as is discussed later), while the Carlmont region generally has the opposite, with gains entering ninth. The result is that the Carlmont region's 6,230 in TK-8, with additional growth projected, is more consequential for the future resident 9-12 numbers than Menlo-Atherton's higher resident TK-8 count is, but the difference is not huge. Applying those losses into ninth to the already low Woodside High TK-8 resident total, by contrast, suggests even greater divergence for the future 9-12 amounts.

Average Student Grade-to-Grade Advancement Rates

Grade-to-grade "advancement" rates are calculations of the change in the number of students in each grade as they graduate into the next grade. Usually such rates are averaged over the last several years within each single-grade advancement to avoid giving too much influence to nuances that may have occurred in any year. These rates are then evaluated for their likelihood to continue, by degree, through the forecast period.

For this study, varying levels of rate determination again have occurred. The most in-depth rate refinements by housing situation are in the BRSSD, MPCSD and LLSD regions.[5] Some housing-situation refinement also has

[5] The TK-8 data shown for those districts in Table 3, however, covers students from much of the SUHSD region (i.e., students enrolled in the BRSSD, SCSD, Redwood CSD, MPCSD and LLSD) for each location listed. This creates modest differences from the totals shown for the same situations in our reports for those feeder districts.

Table 2: Summary of Resident Student Populations by High School Attendance Area*

High School	Section	October 2013 Resident Student Population* TK-2	3-5	6-8	9-11	TK-8	9-12	Res. Stu. Change since Oct. 2010 TK-8	9-12

	Ravenswood CSD part	1,444	1,325	1,209	1,028	3,978	1,464	**-60**	**-45**
	All	8,464	8,453	7,457	6,259	**24,374**	**8,459**	**767**	**508**

* Resident students are those listed at home addresses within the specified area, regardless of the school they attend (among BRSSD, SCSD, Redwood CSD, Ravenswood CSD, MPCSD, LLSD, PVSD, WSD and SUHSD). The only charter school students included are from the charters in the Redwood City SD.

** Portola Valley SD and Woodside SD counts are from student address lists in 2013, with "Tinsley" students from Ravenswood CSD (89) identified accordingly. The student counts for those districts in 2010, however, did not have the "Tinsley" portion identified, so estimated adjustments were made in the 2010 comparison for amounts equal to the current "Tinsley" figures.

Notes: (1) **Students at addresses outside the SUHSD (down from 373 in 2010 to 231 in 2013)** are excluded from these figures. (2) Aspire EPA Academy contributed to the 9-12 drop in Ravenswood CSD area. (3) The grade "TK" refers to the new "transitional kindergarten" program. (4) See Appendix A for additional details to these figures.

been made for these calculations within the Redwood CSD region. Simpler aggregations have been made in the remaining feeder district parts of the SUHSD.

Understanding the Data in Table 3

The latest average advancement rates entering each high school grade are shown on the right side of Table 3 on pages 7 and 8. In the "Modest, Moderate and Hillside Mixed Value" SFD (single family detached) housing group in the BRSSD region, for instance, the "1.05" rate entering ninth grade for "This Study" means that, on average since 2010, a net of 105% of the eighth grade population in one year became ninth graders a year later from the same neighborhoods. That is a modest rise from the 1.02 rate determined in our first (2011-12) SUHSD study.

The cumulative rates shown in the middle section of Table 3 are the result of a compounding of the individual grade-to-grade rates from kindergarten to eighth. These figures show what the net aggregate change would be, if these rates continue, as each group of kindergartners graduates upward through all of the elementary grades. Again using the "Modest, Moderate and Hillside Mixed Value" SFD group within the BRSSD as an example, the "1.06" for the latest period (2010 to 2013) means that 100 students in kindergarten in one year would become 106

* Students listed at addresses in the relevant locations and attending any BRSSD, SCSD, Redwood CSD, MPCSD, LLSD or SUHSD school, except that (1) charters in all but the Redwood CSD are excluded, (2) Ravenswood CSD figures include that district's students as well and (3) PVSD and WSD counts are from combination of those schools' CDE DataQuest enrollments (which includes some "Tinsley" students from the Ravenswood CSD region) and resident students of those regions attending any of the aforementioned included schools. "SFD" covers single-family detached homes and "ATT" represents attached units (i.e., apartments, condos, townhouses and plexes). "Mix" is for planning areas with a thorough mix of SFD and ATT.

** These cumulative rates are the cumulative impact from kindergarten to eighth grade of the individual grade-to-grade net "advancement rates" (a.k.a. "cohort survival rates") averaged over the relevant three-year period, except that Ravenswood CSD rates are provided only for the 2010 to 2013 period (due to a lack of satisfactory earlier data). The LLSD's SFD homes, for example, collectively had net average grade-to-grade advancement rates between Oct. 2010 and Oct. 2013 that combine into a 0.95 cumulative rate. This means that, if these rates continue, there eventually would be 95% as many eighth graders (i.e., a 5% reduction) from these same housing units as there had been kindergartners eight years earlier. **The current cumulative rates and advancement rates that deviate by 10% - 15% from 1.00 (100% advancement) have regular boxing, while those that deviate by over 15% are boxed in bold, for all categories that have 700+ students (in TK-12).**

***** These categories have under 700 students (TK-12), for which such small numbers allow greater rate swings, so the regular boxing is applied to current deviations from 1.00 by 15% to 20% and bold boxing to deviations of over 20%.**

**** The 0.82 advancement rate entering ninth grade in the Ravenswood CSD has only regular (not bold) boxing because much of that reduction is assumed due to students attending Aspire EPA Academy (charter) school.

***** The "other resident" students are attending other feeder districts to the SUHSD (in TK-8) and the SUHSD (in 9-12).

Notes: (1) Figures exclude both inter-district students from outside the SUHSD region (currently 190 in TK-12) and a small number of students listed at home addresses (or no address) that could not be assigned. (2) Figures for all districts but the Ravenswood CSD exclude students enrolled in the Ravenswood CSD (due to data issues). (3) Advancement rates shown are actual calculated rates. These have been modified where warranted in the forecast. (4) See Appendix B for more information.

students eight years later in eighth grade (i.e., a 6% increase). These cumulative figures are a good indication of the net effect that (1) families moving in and out of the districts and (2) students transferring between regular, charter and private schools are having on the K-8 enrollments and the subsequent high school populations.

We have boxed in the table the rates that deviate significantly from 1.00 (100% advancement). Regular boxing has been applied in most cases where the difference is between 10% and 15% plus or minus (i.e., 0.85 to 0.90 for the minus or 1.10 to 1.15 for the gain). More severe differences of over 15% generally are boxed-in-bold. The main exception is in some small-population categories, which can be prone to greater rate swings in such short time periods (i.e., three years). Those generally have regular boxing for 15% to 20% plus or minus and bold boxing for over 20%. The purpose of this boxing is to highlight the situations with the greatest population adjustments occurring (in percentage terms) as the students graduate through the grades.

Also applied, in the version of this report printed in color, is color highlighting for the rate shifts by at least 5% since our original study. Yellow represents gains of at least 5% in the cumulative rates and/or the rates into ninth, while rose represents losses of at least 5% in those rates.

While these rates can seem statistically abstract, they are a critical forecast component.

Key Findings Related to the Data in Table 3

To repeat from the first report: There are huge differences in these rates, with big student gains occurring in some locations and major losses, especially entering ninth, happening in other situations. All but one of the cumulative rates shown in Carlmont's BRSSD and SCSD regions are above 1.00 and that is on top of having had some large kindergarten populations (i.e., the numbers are higher in kindergarten and then getting even larger as each of those student body classes graduates upward). While there was notable fluctuation both ways in these cumulative rates since the 2011-12 study, the collective difference from these rates essentially is the same as in that prior study for the Carlmont region; student growth has been ongoing in the TK-8 population. Adding to that, for the SUHSD-enrolled students, has been a virtual across-the-board jump in the rates entering ninth. The average rate from the more expensive SFD neighborhoods west of 101 in the BRSSD, for example, rose from 0.95 two years ago (from the 2008 to 2011 period) to 1.05 in this study (from the 2010 to 2013 period). That is a 10% increase in the net number of students graduating from eighth to ninth, with corresponding impact on the Carlmont student population (in 9-12). We did not foresee the scope of the rate increases entering ninth in this area, which is a key reason why the updated forecast numbers are higher for Carlmont.

Most of the cumulative and into-ninth rates in the Redwood CSD region are consequentially lower than before. These mainly are from dwellings in the Sequoia and Woodside High attendance areas.[6] We have discounted the more severe shifts in those cumulative rates as being partly nuances of the latest trend period. Now that the local economy is improving, fewer net student losses are expected from housing turnover. The underlying grade-to-grade rates have been adjusted accordingly in the forecast, especially with alternative four-year averages shown in Appendix B. This admittedly is a major judgment call; lower future SUHSD numbers are possible in these two attendance areas.

To also repeat from our original report: One of the biggest issues in the Table 3 data is the low rates entering ninth from the southeastern and southernmost parts of the SUHSD. We do not recall having calculated such declines entering ninth from sufficiently large student populations in any other district. This finding overwhelms everything else being determined in these sections of the SUHSD. The three largest housing categories in the MPCSD region have updated rates entering ninth of 0.87, 0.77 and, in the more expensive SFD places, just 0.72. Those are reductions by 13% to 28%. And the SFD homes in the LLSD region have a 0.79 rate entering ninth, for a net 21% loss. These effectively are all in the current Menlo-Atherton attendance region.

The difference in this update is that these SFD rates entering ninth, as low as they are in the MPCSD and LLSD, all have risen markedly since the original study. This suggests that more families are opting for your public high schools over private alternatives for their children. Since most of those homeowners (in a high-priced housing area) probably can afford private school tuitions, this upward trend indicates improving perceptions of Menlo-Atherton. This could be a double-edged sword, however, because if those rates entering ninth continue to rise as a result, and/or the cumulative rates in the same homes rebound to the previous levels, then the projected totals for Menlo-Atherton could be too low. This is the other major judgment call, in applying these latest calculated rates in the forecast.

[6] The southeast and southern edges of the Redwood CSD are in the Menlo-Atherton area, but those have much smaller student totals than the Sequoia and Woodside sections.

The combined PVSD and WSD enrollment data, which includes some “Tinsley” students from the Ravenswood CSD region, provides only a 0.37 rate entering ninth. Even after adjusting for that “Tinsley” factor, it is clear that the majority of students graduating from eighth grade in those districts are not enrolled in the SUHSD schools in the following year. This impacts the projected Woodside High resident (9-12) total.

The Ravenswood CSD region has a low 0.82 rate entering ninth, which is principally due to students attending charter high schools in that community. Both this rate and the cumulative rate there are reasonable to continue.

SUHSD Enrollment Issues after 2020

There is a nuance occurring in the lowest elementary grades that will impact the SUHSD enrollment after 2020. The birthdate cutoff for kindergarten eligibility is evolving from December 2 to September 1. This is being phased in over three years, with the current school year being the second of those three years. The net effect is that there will be three adjacent student body classes that officially cover only 11-month birth periods. The State also has created a new program called “transitional kindergarten” (TK) for those children who previously would have been eligible for kindergarten each year. This is expanding from covering a single birth month in 2012-13 (essentially November 2007) to two months this year (October and November 2008) and three months in all future years. Most districts are operating these TK programs with those students to be enrolled in kindergarten in the following year. There thus is still a six-year birth period for the current TK-5 enrollment, just as in the past, but with one fewer month in each of kindergarten and first, with two months in TK.[7] Next year will have kindergarten, first and second covering 11-month birth periods and TK covering three months of births. Those three student body classes containing 11-month birth periods will start graduating into ninth in 2021-22 and be fully in the SUHSD grades in 2023-24 and 2024-25.

A few districts, however, did not have much of a drop in kindergarten and/or first despite this 11-month eligibility period. This includes the BRSSD and SCSD, with corresponding 2021 and 2022 impacts especially on Carlmont. That school’s resident total could go slightly higher in those years. Thereafter relatively low birth totals in the economic recession (2009 to 2011) should cause the resident numbers in all four SUHSD regions to decline.

Concluding Commentary

The State’s educational scores for each school and district continue to be an enrollment issue. Although a different evaluation method is about to occur, the relative determinations are unlikely to dramatically shift. Having the public perceive that one of your schools is meaningfully superior, due to such web-posted ratings, could have a snowballing effect, with more high scoring students finding ways to get into that school and out of the other schools. How you adjust your attendance areas and/or your intra-district enrollment policies will have an impact on those decisions and the resultant school enrollments.

Sincerely,

{Signature not provided with electronic PDF version}

Thomas R. Williams, principal demographer for Enrollment Projection Consultants

[7] The current TK+K totals in Appendix B cover a 13-month birth period (11 for K and two for TK) accordingly, which can make those amounts look deceptively higher than those in some other grades.

(Columns K-2 through 9-12 are under the heading "Resident Student Population".)

* Resident students are those listed at home addresses within the specified area, regardless of the school they attend (among the school districts listed). The only charter school students included are from the charters in the Redwood City SD.

** Portola Valley SD and Woodside SD counts are from the DataQuest section of the CDE website prior to 2013, which includes "Tinsley" students from Ravenswood CSD area. To be consistent, the 2013 counts were comparably made in this table only.

Notes: (1) Changes are over three years for groupings of three grades, with TK-2 compared to the prior K-2, 3-5 to the prior K-2, 6-8 to the prior 3-5, 9-11 to the prior 6-8, TK-8 to the prior K-8 and TK-12 to the prior K-12. (2) Totals by elementary SD regions may differ slightly between this and other tables because some student addresses could not be precisely located, such as by a housing type, but were assignable by larger areas such as high school attendance areas. (3) Totals do not add up to aggregate enrollments of all relevant districts because both addresses outside the SUHSD region and completely unassignable addresses are excluded from these totals.

* Student counts for a portion of the Sequoia High attendance area that is in the San Carlos SD region were incorrectly included in figures from the Redwood City SD region in last year's study. This has been fixed for the counts in all years in the current update. The aggregate historic counts for the Sequoia High region are the same as before.

Notes: (1) Student counts are from combination of BRSSD, SCSD, Redwood CSD, MPCSD, LLSD and SUHSD files. (2) Final year weighted 150% in four-year change rates.

MENLO-ATHERTON HIGH SCHOOL

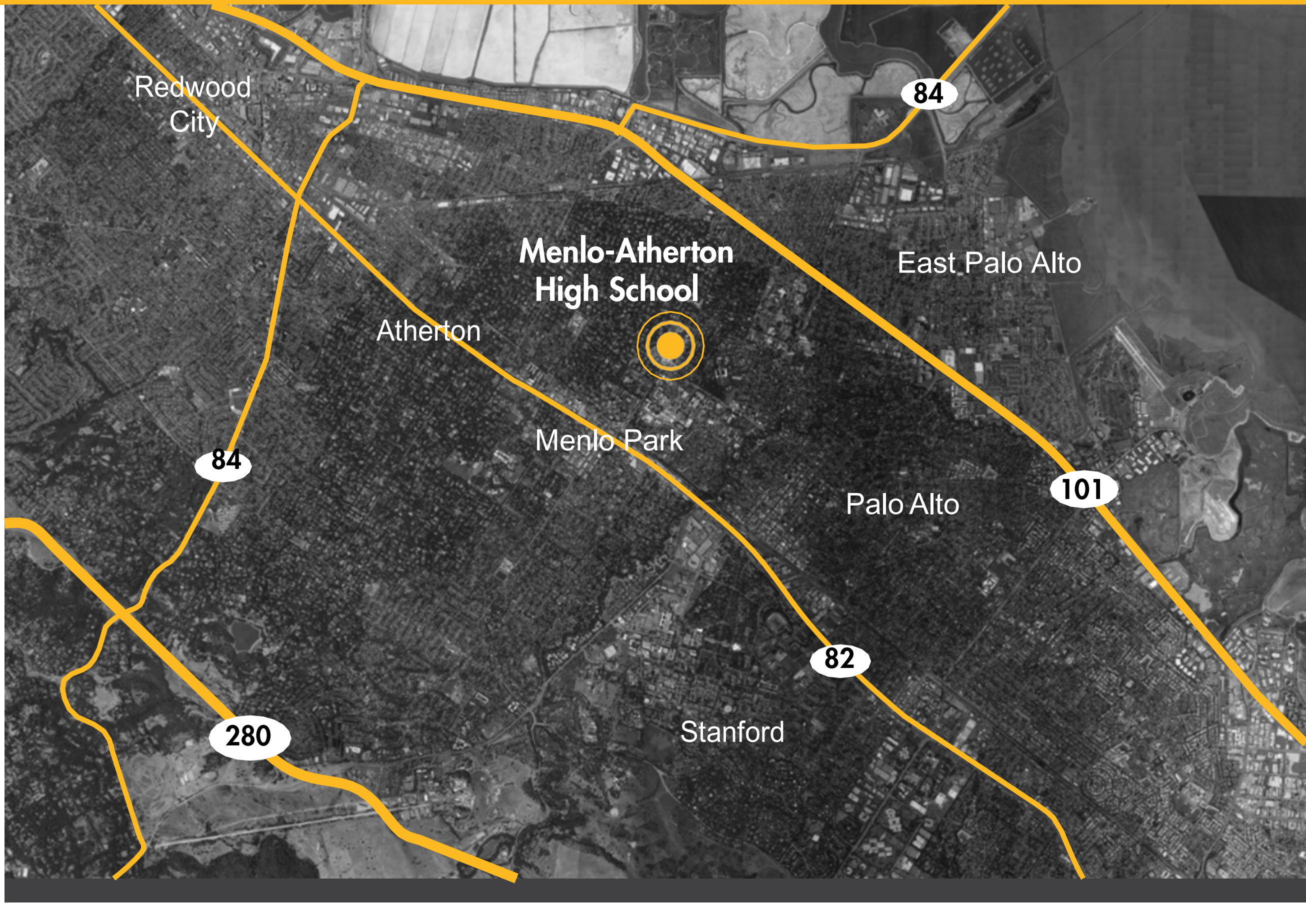
MENLO-ATHERTON HS: BACKGROUND

Menlo-Atherton is a four-year public comprehensive secondary school located in Atherton, California, a suburban community between San Francisco and San Jose in close proximity to Stanford University and Silicon Valley. Established in 1951, the school is part of the Sequoia Union High School District, which consists of four comprehensive high schools and a continuation high school. The school serves the cities of Atherton, Menlo Park, Redwood City, East Palo Alto, and Portola Valley, supporting a diverse community with high academic expectations. The school was named one of the top secondary schools in the nation by the United States Department of Education as part of its National School Recognition Program and recently also awarded California Distinguished School by the State Department of Education.

The current enrollment at Menlo-Atherton High School as of January 2015 is 2,167 students. The existing campus has a total of 95 Classrooms/ Teaching Stations. Enrollment is projected for the next 5 years to increase to 2,603* in October 2020, resulting in a need of 117 Classrooms. (*Enrollment projection per District demographics consultant).



PLANNING PROCESS: OVERVIEW

The Site Facility Master Plan Committee (SFMPC) for Menlo-Atherton High School was formed with a group of dedicated participants who met in a series of scheduled meetings throughout the master plan process. The process included open discussion and activities to gather information on existing conditions and issues, and come to consensus on the committee's long term goals, opportunities and possible solutions. The process began in July 2014 and will conclude with a final presentation to the Board of Education in April 2015.

The first focus of the committee's meetings was on Phase 1 requirements for accommodating growth at the site. The recommendations were summarized in the "Facilities Master Plan and Phase 1 Project Board Update" document presented to the Board on August 28, 2014. In order to ensure we were able to meet the construction schedule, the team in collaboration with the District decided to split the Phase 1 project into two increments: Increment 1 which includes the site utilities, and Increment 2 which includes the building. Construction for Increment 1 is projected to commence from May 29 - Sept. 10th, 2015 and for Increment 2 from Oct. 26, 2015 - Dec. 30, 2016.

As a concurrent project, the SFMPC began to discuss in September 2014, the longer term needs of the campus beyond the Phase 1 Classroom building. These included the 5-Year Capital Repair Plan scopes, Phase 2 new construction to accommodate growth, and Phase 3 modernization needs and support program spaces improvements, as well as proposed future projects. Below is an overview of the SFMPC meetings and agendas.

The following is a summary of the topics discussed at each of the Facilities Master Plan Site Committee meetings:

Meeting #1
- Review Meeting Dates & Agendas
- Start Capital Repair Plan Scope of Work discussion
- Discuss appropriate forums for authentic engagement of stakeholder community
- Pride Hallway student circulation

Meeting #2
- Facilities Needs Assessment Survey Report
- Capital Repair Plan items
- Facilities Task Force projects
- Educational program opportunities
- Campus influences analysis
- Charette

Meeting #3
- Demographic Projections Overview
- Review feedback from Stakeholder groups outreach meetings
- Present preliminary educational program
- Present idea plans and master plan options

PHASES COST

	PHASE	EST. COST
MEASURE A	Phase 1	$28,062,865
MEASURE A	5-Year Capital Repair	$5,245,988
MEASURE A	Phase 2	$15,769,478
MEASURE A	Phase 3	$2,812,125
	TOTAL	$51,890,456

PLANNING PROCESS: STAKEHOLDERS

Meeting #4
- Present final educational program
- Teaching station analysis
- Discuss refined campus master plan
- Packing of projects and phasing options priorities

Meeting #5
- Present Master Plan cost estimate
- FTFNA & Phase One budget analysis
- Prioritization exercise
- Discussion + Next Steps

Student Meeting
- Red dot/ Green dot exercise
- Campus likes vs. dislikes discussion
- 'If you could dream' discussion

PTA Meeting
- Update of new Phase I project
- 'If you could dream' discussion

PTA Meeting
- 'If you could dream' discussion

Staff Meeting
- FMP Update presentation

SUMMARY

At the start of the facilities master plan (FMP) process, the Site Master Plan Committee was formed for Menlo-Atherton High School (M-AHS). The committee members included both staff and students, with LPA as the master plan consultant. In addition to committee meetings, stakeholder outreach included several meetings with Maintenance & Operations, student interview with follow up survey, teacher/ staff presentation, discussion and survey, a PTA presentation, discussion and survey, and open-to-all townhall meetings where students and the community were involved.

The first meeting set the tone for the planning process and established meeting dates and agendas. A meeting with Maintenance and Operations (M&O) group to discuss and establish scope for the Capital Repair Plan was set. Discussion regarding Pride Hall, a major student circulation access at M-AHS and concerns with student restroom access and quantity of fixtures was also initiated.

Meeting #2: the committee discussed the projected teaching station analysis presented by LPA, based on graduation requirements, existing teaching stations and preliminary demographic projections. The school's enrollment is projected to increase from 2,167 to approximately 2,643 by 2020. This number has now been corrected by the District's demographics consultant to 2,603 which would result in an increase in required teaching stations from 95 to 114, assuming the current Classroom to teacher ratio of 0.85. If the District classroom to teacher ratio of 0.95 was to be met, this would increase the need for teaching stations even more. LPA also reviewed with the committee the results of the facilities needs assessment, and presented potential solution options. Other educational program opportunities discussed included clustering of classrooms by subjects, locker room and student service office needs.

Meeting #3: the demographic projections were further reviewed and an analysis was presented to demonstrate the number of teaching stations required versus phase of work. The budget established by the FTFNA was reviewed and initial locations of Phase 2 new construction scope of work were explored. LPA took into account committee comments to develop the options for Phase 2 presented at the next meeting.

Meeting #4: the scope of work and the budget vs. actual costs for Phase 3 modernization scope was discussed in further detail. The committee agreed that the scopes of work will need to be prioritized to meet the budget amount. The proposed improvements to Pride Hall to enhance the circulation, was approved by the committee. The Capital Repair plan was discussed and allocated vs. the school's needs, the Committee agreed because there is a negative delta between the budget these would need to be prioritized by M&O. Phase 2 options were presented and the Committee liked the idea of two separate buildings; one to replace the existing Food Service Kiosk and Restroom buildings and another to house the Labs. The committee asked LPA to explore locating the Lab building at the tennis court to the East of the Library. Long term Master Plan Future / Unfunded Projects were discussed. The group agreed to include a better school entry, locker room improvements, Team Rooms addition, Student Union connected to Administration and Guidance building along with fulfilling the teaching station needs.

Meeting #5: the Committee reviewed the enrollment projection analysis vs. construction phasing, presented by LPA. FMP budget was reviewed against the master plan cost estimate. A scope prioritization exercise was conducted and Phase 3 scopes of work were prioritized as shown in the following pages.

At the Student Engagement meeting, students were asked to place on the campus map a 'green' dot on areas they liked vs. a 'red' dot on areas that could be improved. The students raised important needs that included: improvements to circulation at Pride Hall, modernization of the old locker rooms, improvements to athletics, ventilation / air conditioning in Classrooms, more comfortable Classroom furniture, usable outdoor spaces, more shade, more restrooms and a Student Union for hanging out.

At the PTA meeting, parents and community members had an 'If you could dream...' discussion about the M-A HS campus. Issues that came out of the discussion included the following: better cafeteria with more food choices, more trees and shade, new connection from the Library to the Stadium, relocate trash cans, quieter HVAC at Classrooms, better/ cleaner bathrooms, more drinking fountains and bottle filling stations, improve circulation between classrooms, more WiFI access points, and a permanent place for PTA group storage of materials.

CAPITAL REPAIR PLAN, PHASE 1 & 2 ESTIMATED COSTS

SUHSD FMP Budget Tracking

PHASE 1 ESTIMATED COSTS

SCOPE OF WORK

1. Demo existing 11 Classroom Building (G Wing)
2. New Construction: 2-Story, 21 Classroom Building with Food Service

Total: $28,062,865

	SCOPE DESCRIPTION	COST
	Classroom and Food Service Building	$28,062,865

5-YEAR CAPITAL REPAIR PLAN

* Reference pages 14-19 for scope of work categories and descriptions.

Total: $5,245,988

	SCOPE DESCRIPTION	COST
	5-Year Capital Repair Plan	$5,245,988

PHASE 2 ESTIMATED COSTS

SCOPE OF WORK

1. Demo existing Food Service Kiosk, Restroom Building and one Tennis Court
2. New Construction: 2-Story Lab Building with (2) CTE Labs, (2) Biology/ Environmental Science Labs, and (2) Physics Labs
3. New Construction: Food Service + Kitchen and Restroom Building
4. Expand and Reconfigure existing Student Services
5. Add Skateboard Lockers to "Hello Hall" in areas where existing lockers were removed.
6. New Bike Storage Areas with Bike Racks, enclosed w/ Chainlink Fence & Gate

Total: $15,769,478

ITEM NO.	SCOPE DESCRIPTION	COST
2	Lab Building	$9,996,000
3	Food Service / Restroom Building	$4,750,000
4	Student Services Reconfiguration	$1,005,000
5	Add Skateboard Lockers to "Hello Hall"	TBD
6	New Bike Storage Areas w/ Chainlink Fence & Gate	TBD
	TOTAL	$15,751,000

PHASE 3 ESTIMATED COSTS & FUTURE PROJECTS

PHASE 3 ESTIMATED COSTS

The scopes of work are listed in the order of priority as discussed at the committee meeting at the end of February 2015. Scope numbers 1 through 4 are the prioritized scopes of work and align with the original SUHSD FMP budget. Items below the line (Items 5 and 6) will remain on the list and will be addressed at a later time as funds become available in the future.

* Reference Phase 3 Master Plan Diagram on page 24 for where scopes of work occur. Item numbers correspond to numbers in the Legend.

SUHSD FMP Budget Tracking

$975,000

$1,837,125

Total: $2,812,125

ITEM NO.	SCOPE DESCRIPTION	COST
1	Field Lighting	$1,050,000
2	Pride Hall Improvements	$308,668
3	Pride Hall Restroom Convert to Storage	$50,000
4	Convert C-2 to Chemistry Lab	$910,000
	Sub-Total	$2,318,668
5	Improve Ventilation at Building D/E	$75,000
6	Shower/Locker Room Mod Boys Girls	 $815,000 $850,000
	Sub-Total	$1,740,000

FUTURE PROJECTS PHASE

The Future Projects Phase includes proposed future projects that are currently not funded, but are part of the Facilities Master Plan to address identified campus needs.

SCOPE OF WORK DESCRIPTION

1. Demo Buildings C, D-E, H, Admin, and Student Services / Resource Building
2. New Construction: 2-Story Academic Classroom / Lab Building
3. New Construction: 2-Story Administration, Student Services, Student Union Building
4. Modernization/ Reconfiguration of existing Boys and Girls Locker Rooms and Athletics Addition at old, Main Gym
5. Addition of lighting and re-surfacing at existing Tennis Courts
6. Replace existing turf with Synthetic Turf at Soccer Field
7. New Staff Parking Lot

MENLO-ATHERTON HS: PHASE I - PLAN

The proposed Phase One Classroom Building at Menlo-Atherton High School has been planned to address the projected increase in student enrollment at the campus. The new building is to be located at the site of the current Building 'G'.

The (11) eleven existing modular classrooms of Building 'G' will be demolished and replaced with a new (21) twenty-one classroom 2-story building, for a net increase of (10) ten teaching stations at a gross program square footage of 43,730sf. Additional facilities proposed as part of the program include staff workroom/collaboration spaces, student/staff toilets, a food service serving kitchen and covered student dining. These elements are currently deficient on campus and were also highlighted as part of the District's Facilities Task Force Needs Assessment report.

SCOPE OF WORK

1. DEMO (E) 11 CLASSROOM BUILDING (G-WING)
2. NEW CONSTRUCTION 2-STORY 21 CLASSROOM BUILDING WITH FOOD SERVICE

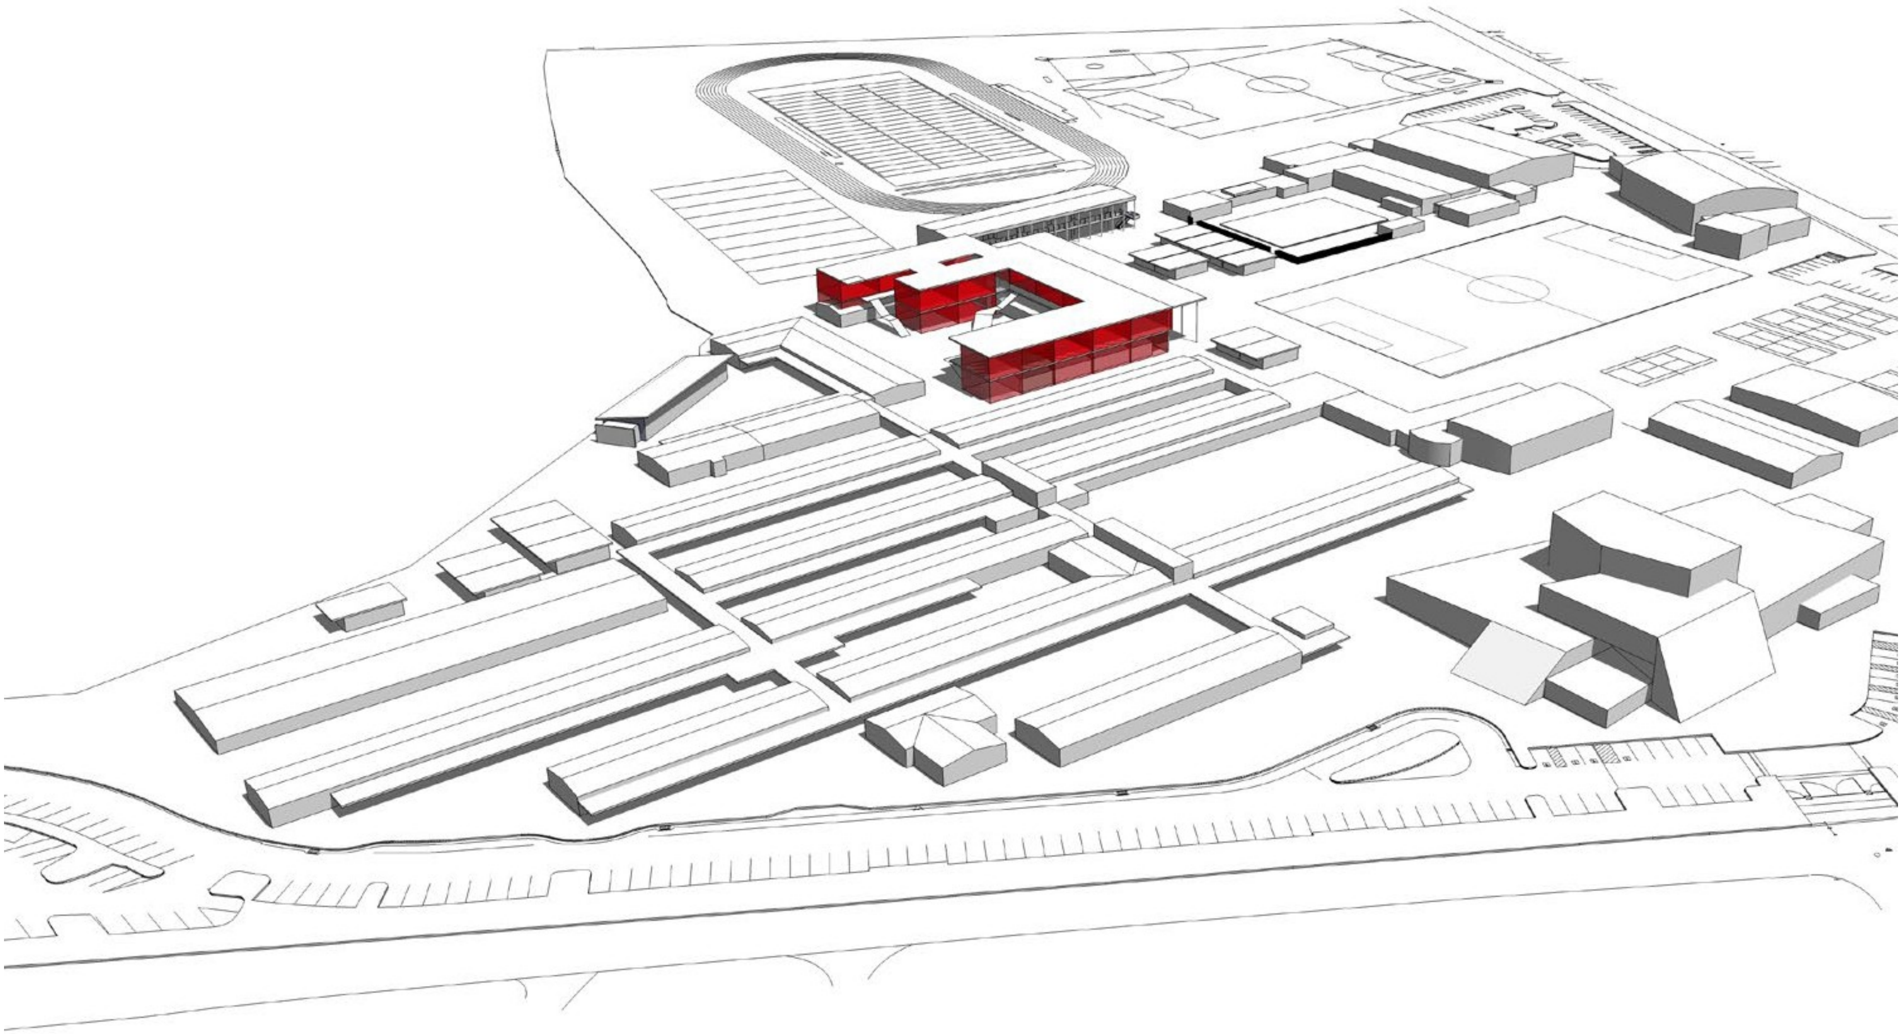
$28,062,865 . . . . PHASE 1

Menlo-Atherton High School South-East Elevation

MENLO-ATHERTON HS: PHASE 1



PRIORITIZED SCOPE CATEGORIES

1. ADA Compliance

The following work is required to meet ADA compliance requirements:

- Add 48 inch opening in chainlink fence at track and field.
- Add concrete paving at ADA path of travel to North baseball field.
- Add concrete paving between batting cage and bench area at baseball field.
- Add concrete paving at bleacher floor, East baseball field.
- Add 5% slope transition for 2 inch elevation delta between bleacher floor and walkway, at East baseball field.
- Add 6'-0" long transition ramp to Ringwood Ave. sidewalk (1:12 slope max. with top and bottom landing and handrails), at North-East corner of Parking Lot.
- Provide minimum 1 accessible gate at track access from Parking Lot at Ringwood Ave. Add 10" bottom plate and push bar.
- Add truncated domes at drop-off and flush curb area in parking lot at Ringwood Ave.
- Add handrails at 2 existing ramps that are greater than 13% slope, north of I Wing.
- Replace all exterior drinking fountains to ADA compliant.
- Add cane detection side rails at drinking fountain at Concessions building.
- Site restrooms are in general ADA compliant. A few door locks, grab bars, and signage need to be replaced.
- All gates at the tennis court area need to be replaced to ADA compliant. One landing connected to path of travel between parking lot and tennis court needs handrails.
- Remove existing transition and add 6'-0" long transition ramp from tennis court to Parking Lot B off Ringwood Ave.
- Install lift for stage at Drama Classroom C16.
- Provide ADA compliant signage throughout campus.
- Reset / replace interlocking pavers that have shifted to mitigate potential tripping hazard.

2. Asbestos Mitigation	The District needs to hire a consultant to determine what specific areas/ materials need to be removed / abated. For all modernization projects, include an allowance for unknown and unforeseen mitigation.
3. Code Compliance Issues	• Per 2013 CBC, for a campus of 2,600 students, nineteen (19) drinking fountains are required. There were only twelve (12) drinking fountains counted on the site. From those, only one was ADA compliant. • Add drinking fountains at the playfields.
4. Electrical Upgrades	• Provide backup generators at the main gym. • Provide electrical upgrades at mechanical rooms and various Classrooms. • Enclose all exposed electrical equipment. • Campus electrical power distribution is comprised of underground feeders at 4160V, 3 phase. The wires found in the manholes vary in size. The new Phase 1 building requires up-sizing of the feeder to this side of campus to accommodate added load. It is recommended that all distribution wire throughout campus be replaced and up-sized accordingly. Remove all abandoned feeder wires. • If HVAC improvements add cooling capacity to existing buildings, the electrical distribution and panels at that building will need to be evaluated to determine if they can support the added load.
5. Fire and Life Safety	• Upgrades to fire alarm systems, as required. • Upgrades to security system. Scope and detail to be determined.

6. Heating and Ventilation	• Boiler systems were reviewed and were determined to be in good working order. • Replace domestic boiler in "T" Wing. This domestic water boiler has been repaired and is functioning well. This item can be removed. • Replace furnaces at B, C, D, E, F Wings (45 total) with hydronic fan coil units located outside the classroom. • Implement HVAC automation campus wide with DDC controls based on District standards.
7. Finish Floor Replacement	Replace all finish flooring at the end of its life cycle. New flooring to comply with District standards. Replace flooring in the listed rooms with new VCT flooring. Apply waterproof sealant to existing concrete slab and prepare for new floor finish. • Radio Station • B-1, B-2, B-3, B-4 B-11 • C-5, C-10, C-11, C-14, Offices between C-15 & C-16, C-16 • D-1, D-2, D-13, D-16, D-21, D-24 • E-0, E-25 Mechanical polishing/ grinding of existing concrete floor is recommended for the below listed rooms. Seal floors: • Boys locker room offices (3 total). • Water polo room • Pool office
8. Roof Replacement	• Replace sixty (60) 4' x 4' skylight units at the main Gym. • Remove existing roofing system at existing arcade and replace with District Standard roofing system. Slope needs to be added to roof possibly through built up rigid insulation to allow for water flow to drains.

M-AHS: 5-YEAR CAPITAL REPAIR PROJECTS

UNFUNDED SCOPE CATEGORIES

9. Energy Efficient Projects	• Provide electric charging station next to ADA stalls at the main parking lot, South of the Performing Arts Center and Main Administration.
10. Landscaping	• Tree assessment by a certified consulting arborist to determine the health of all trees on campus is recommended. • Tree mitigation ton include removal and replacement of unhealthy trees, and pruning of hazardous branching conditions. • Overall campus pruning to enhance structure and health of existing trees to remain is recommended. • Irrigation assessment to determine upgrades required for more efficient use of water, addition of a central control system and replacement of outdated and inefficient irrigation equipment. • Assess and repair the well system that provides irrigation to portions of the campus. • Verify the purpose of the 4' moat around existing oaks with a certified consulting arborist, and adjust as recommended.
11. Locker Room Repairs	• Provide modernization at main locker rooms at Main Gym. • Remove benches as required to provide 44" minimum ADA path of travel at Boys Locker Room. • Replace 5% lockers and benches with ADA compliant. • Install new 18" x 18" top and bottom lockers, for a total of 72 units at Boys Locker Room and at Girls Locker Room. • Provide accessible shower stall at Student showers and at Staff shower.

12. Painting	• New paint for all window frames and trims, including fascia and gutters throughout campus. • New paint for all buildings in the pool complex and old/ Main gym complex. • New paint for the exterior of the Teacher's Resource Center
13. Plumbing Upgrades	• Add drinking fountains at the playfields (football and baseball). • Convert twelve (12) existing wall plumbed showers to surface mount shower heads at Boys Locker Room • Replace water mains at B, C, D, E Wings. • Replace sanitary sewer from Senior Green to main at Oak Tree. • Repair/ replace sanitary sewer under C-0.
14. Sports Facilities	• Tennis courts need to be resurfaced; seal cracks, 2" AC pavement topping. Improve shed plane (slopes) and apply new finish coating (potentially the Draco system) and striping at all courts. • The track needs a new finish coat; match existing color. The rubberized track is in good condition (approximately 1/2" thick mat). The color is fading slightly. All tracks need to be re-striped.
15. Traffic Flow	• There is no work assigned to this category.

16. Window Replacement	• All existing classroom building window sills have dry rot which are not currently included in the maintenance plan. Window frames will need to be removed for sill replacement.
17. Parking	• Parking lots have potholes and cracks throughout the AC paving throughout. Patch and repair as required with new slurry coat.
18. Building Repairs	• Install bird protection net underneath exposed steel overhang areas at the Performing Arts Center (approx. +/- 4,600 sf). Spike-type bird deterrents currently utilized in some areas do not work well.

PHASE 2 -PROPOSED MASTER PLAN

The proposed scope of work for Phase 2 at Menlo-Atherton HS again addresses additional teaching station needs, improves a food service facility atthe center of campus, and addresses Student Services offices space needs. The existing 7th tennis court East of the Library will be demolished to build a new 2-story Lab building with Physics Labs, CTE Labs, Biology/ Environmental Science Labs and restrooms, for a gross square footage of 12,000sf. The existing modular Food Service Kiosk and restroom structure will be demolished and replaced with a new, 4,330sf permanent construction Food Service and restroom facility that includes Staff and Student Restrooms. The existing Student Services offices will be expanded and reconfigured to better serve their needs. Skateboard lockers will be added to 'Hello Hall' and bike storage displaced by new construction will be replaced with new.

SCOPE OF WORK

1. DEMO (E) TENNIS COURT, FOOD SERVICE KIOSK PORTABLE & RESTROOM BUILDING
2. *NEW CONSTRUCTION: FOOD SERVICE & RESTROOM BUILDING
3. NEW CONSTRUCTION: 2-STORY LAB BUILDING
4. RECONFIG. STUDENT SERVICES
5. ADD SKATEBOARD LOCKERS TO "HELLO HALL"
6. NEW BIKE STORAGE

* In order to remove the six (6) Portable Classrooms, the Food Service/ Restroom Building will need to be 2-Stories in order to meet the Teaching Station requirements based on projected enrollment. This scope is beyond the budget established by the FTFNA.

M-AHS: PHASE 2 - STUDENT SERVICES DIAGRAM

To address the additional space needs of the Student Services offices at Menlo-Atherton High School, the below diagram depicts an expansion of the space into Room B-12 and a reconfiguration. The diagram is just a test fit and will need to be reviewed with a Site Committee when a Design Team comes on board. Existing conditions will also need to be verified. The spaces that function well will remain; these include the Career Center, Presentation Room, (3) of the larger Guidance Offices, (2) of the Mental Health Offices and the existing Restrooms. The rest of the space will be reconfigured into additional, appropriately sized Guidance Offices, Mental Health offices, a Conference/ Lounge / Workroom, and a File/ Record Storage Room. The front entry will be reconfigured to provide a more open and welcoming entry with a lounge-like student waiting area. The square footage of the new Student Services area is approximately 5,600sf.

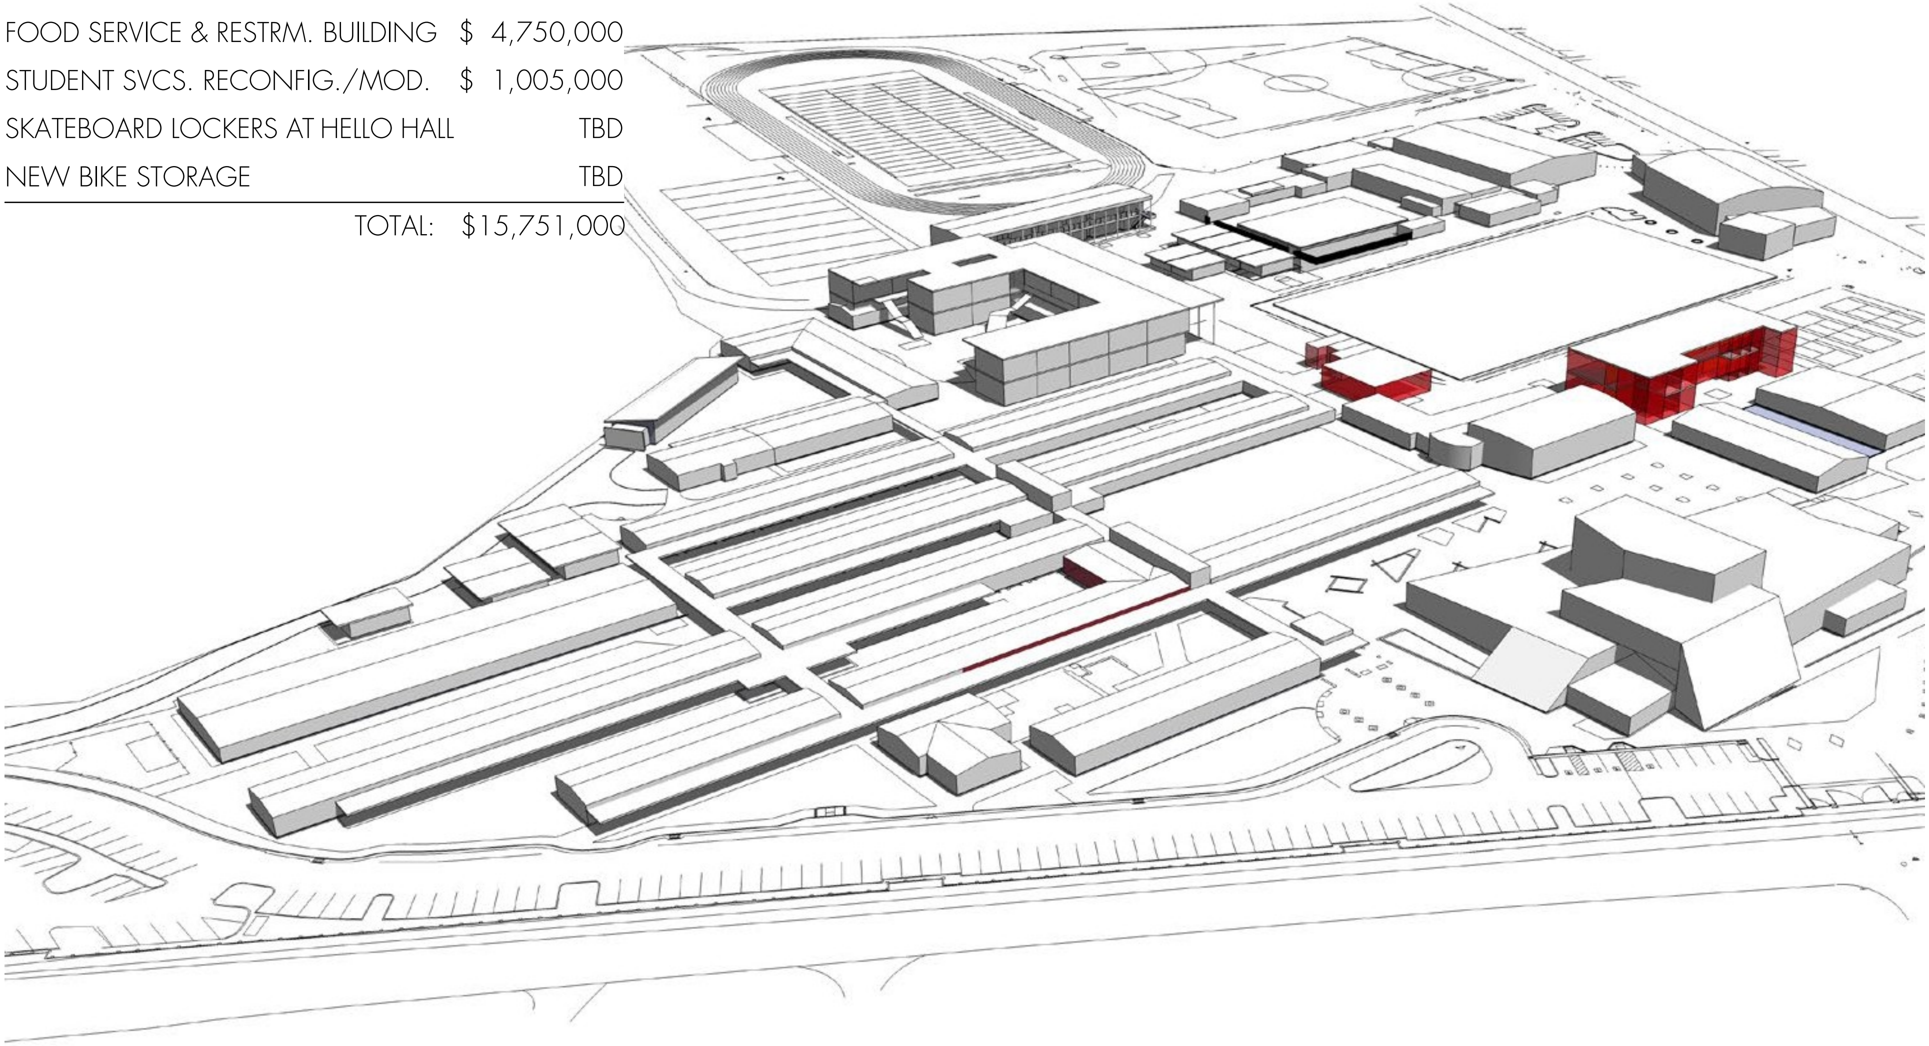
NEW BIKE STORAGE	TBD
TOTAL:	$15,751,000



Menlo-Atherton High School

PHASE 3 - PROPOSED MASTER PLAN

The proposed scope of work for Phase Three at Menlo-Atherton High School is to address the long term improvement needs of the campus. This work will include improvements to Pride Hall, field lighting at the soccer field, modernization of the shower/ locker rooms at the Main Gym, and the conversion of a Classroom to meet program needs. Reference page 7 for estimated costs.

SCOPE OF WORK

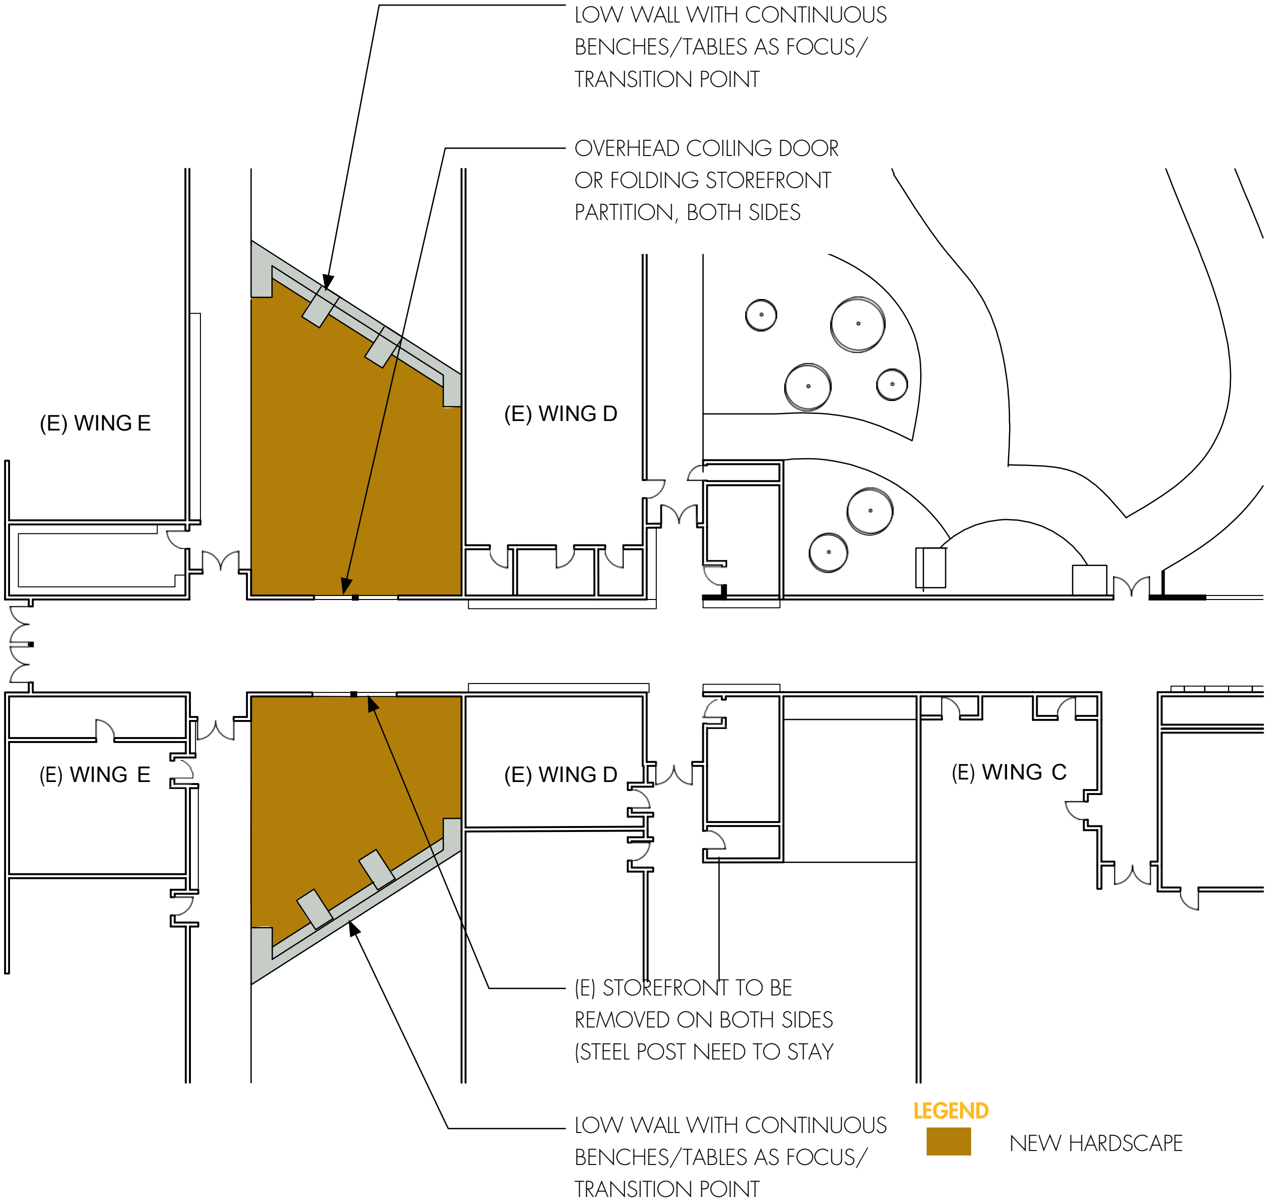
1. ADD FIELD LIGHTING TO SOCCER FIELD
2. PRIDE HALL IMPROVEMENTS
3. CONVERT RESTROOMS TO STORAGE
4. CONVERT CLASSRM. C-2 TO CHEMISTRY LAB
5. IMPROVE VENTILATION AT D-E WING
6. GYM SHOWER/LOCKER ROOM MODERNIZATION

Menlo-Atherton High School

PHASE 3 - PRIDE HALL IMPROVEMENTS

Pride Hall at Menlo-Atherton High School is a main circulation spine that runs North-South on the campus. Students utilize this enclosed hallway to access various academic wings and restrooms. The hallway is currently narrow and dim, creating congestion making access difficult and unsafe at times. The proposed improvements open up the area between 'D' Wing and 'E' Wing to create a larger through access in this space to alleviate the congestion at the most critical area. In addition to Pride Hall, improvements in other phases of work include the addition of student restroom facilities at all areas of new construction to offload some of the pressure within this main access-way.

M-AHS - BETWEEN D AND E WINGS



PROPOSED FUTURE PROJECTS: MASTER PLAN

The scope of work for proposed future projects at Menlo-Atherton HS addresses additional teaching station needs due to projected increase in student enrollment, consolidates the administrative and student services functions, provides a Student Union collaboration space and redefines the main campus entrance. It also addresses the deteriorated Locker Rooms at the old Gym and builds a 5,275sf addition to address the Athletics space needs. The new Academic building will be 51,500sf, and the new Campus Student Center/ Administration building will be 26,945sf.

SCOPE OF WORK

1. DEMO BUILDINGS C, D-E, H, ADMIN. & STUDENT SERVICES/ RESOURCE CENTER
2. NEW CONSTRUCTION: 2-STORY ACADEMIC CLASSRM/LAB BLDG.
3. NEW CONSTRUCTION: 2-STORY ADMIN./ STUDENT SVC./ STUDENT UNION
4. MODERNIZATION/ RECONFIG. OF LOCKER ROOMS & ATHLETICS ADDITION
5. TENNIS COURT LIGHTING
6. SYNTHETIC TURF
7. NEW STAFF PARKING

Menlo-Atherton High School

PROPOSED FUTURE PROJECT: ACADEMIC BUILDING

To address the increase in student enrollment and the need for additional teaching stations, the program for the new 2-story Academic Building will include science laboratories with prep rooms, general ed classrooms, special education classrooms, staff collaboration PLC's and student and staff restrooms. The central courtyard areas will include hardscape and landscaping that will enhance the educational program.

ACADEMIC BUILDING

PROPOSED FUTURE PROJECT: ACADEMIC CTR./ADMIN.

At Menlo-Atherton High School, the Administration offices, Student Services, and Guidance offices are located in three separate buildings. The program for the new 2-story Campus Academic Center / Administration Building will house all the administrative and student services functions in one place. A central Student Union will provide a place for collaboration and student to student and student to staff social and academic interaction. This new building will redefine the main entry of the campus and connect to the main access spine, Pride Hall.

CAMPUS ADMINISTRATION/ STUDENT SERVICES CENTER

PROPOSED FUTURE PROJECT: TEAM ROOM ADDITION

At Menlo-Atherton High School, the existing locker rooms at the old, Main Gym have never been modernized and lack Team Rooms to support athletics programs. The new one-story athletic support spaces addition at the existing main gymnasium will address the need for adequate Team Rooms to support the Athletics program. The program for the addition includes Team Rooms, a Visiting Team Room and Athletic Equipment Storage room. All home Team Rooms to include deep lockers to store student athletic equipment and benches. The Visiting Team Room will have benches around the perimeter and an interactive whiteboard.

Menlo-Atherton High School

LIBRARY SERVICES

October 20, 2015

Susan Holmer, Library Director
Menlo Park Libraries
701 Laurel Street
Menlo Park, CA 94025

Re: Library Services

Dear Susan Holmer:

The City of Menlo Park is currently updating the Land Use and Circulation Elements of the General Plan, which were last comprehensively updated in 1994. In addition, the City is updating the Bayfront Area Zoning ordinance. Collectively, the updates are referred to as ConnectMenlo. Both the General Plan Update and the Zoning Ordinance Update are summarized below, followed by Table 1, which is the existing and proposed 2040 Horizon-Year Buildout Projections. As shown in the table, the projected growth for the proposed ConnectMenlo Project for the 2040 horizon year, plus the Current General Plan development potential (but not including Facebook Campus Expansion), is 4.1 million square feet of non-residential space, 400 hotel rooms and 5,500 residential units, and up to 14,150 new residents and 9,900 employees.

General Plan Update

The proposed Land Use and Circulation Elements are intended to guide development and conservation in the city through the 2040 buildout horizon of this General Plan. These two elements are central components of the General Plan because they describe which land uses should be allowed in the city, where those land uses should be located, how those land uses may be accessed and connected, and how development of those uses should be managed so as to minimize impacts and maximize benefits to the city and its residents. The Land Use Element frames the type and scale of potential development that may occur over the next 24 years, particularly in the Bayfront Area. The Circulation Element addresses transportation issues throughout the city. Both updated Elements have been written to be consistent with the other General Plan Elements and the 2012 El Camino Real/Downtown Specific Plan.

Bayfront Area Zoning Ordinance Update

The Project includes an update to the City's Zoning Ordinance for the Bayfront Area formerly referred to as the "M-2 General Industrial Zoning District", including both development regulations and design standards, to ensure consistency with the General Plan Update and previously adopted ordinances and policies. The proposed Zoning Ordinance Update would create the following five new districts, which would apply to lands within the Bayfront Area: Light Industrial (I-L), Business Park (C-BP), Office/Tech/Research and Development (O), Life Sciences (LS), and Mixed Use Residential (R-MU). These districts are intended to foster innovation and emerging technologies; promote the creation of an employment district with travel patterns that

are oriented toward pedestrian, transit, and bicycle use; and provide amenities to surrounding neighborhoods and fiscal support to the City leveraged through development intensity bonuses. The standards for development within the LS and O districts allow increased development intensities with the provision of community amenities.

TABLE 1 EXISTING AND PROPOSED 2040 HORIZON-YEAR BUILDOUT PROJECTIONS

Category	Existing Conditions[a]	+	"Approved" Projects[b]	+	Current General Plan[c]	+	Proposed Project (Bayfront Area)[d]	=	Maximum Citywide 2040 Buildout[e]

Notes: *Numbers are estimates and rounded for the purposes of this programmatic environmental review.*

a. Includes existing development on the ground.

b. Includes reasonably foreseeable projects (i.e. pending applications, recently approved, or under construction) in the Study Area; including the current Facebook Campus Expansion Project shown in a separate column. A list of approved projects is shown in Chapter 4, Environmental Evaluation, of this Draft EIR.

d. This represents what could be built if the proposed ConnectMenlo project were not approved, which is the "No Project" condition discussed in Chapter 5, Alternatives to the Proposed Project, of this Draft EIR.

e. The Proposed Bayfront Area development potential represents increased development potential for the Bayfront Area only, but does not include the Facebook Campus Expansion Project, which is shown in a separate column.

f. The Maximum Citywide Buildout represents the total of the 5 previous columns.

g. Potential Commercial square footage in the Bayfront Area would occur within Office and Residential districts.

h. An unknown number of additional hotel rooms could be proposed under the current General Plan; Hotel square footage is not included in the

TABLE 1 EXISTING AND PROPOSED 2040 HORIZON-YEAR BUILDOUT PROJECTIONS

Category	Existing Conditions[a]	+	"Approved" Projects[b]	+	Current General Plan[c]	+	Proposed Project (Bayfront Area)[d]	=	Maximum Citywide 2040 Buildout[e]

Facebook Campus Expansion Project and Proposed Bayfront Area development potential non-residential square feet.
i. Assumes 2.57 persons per household per Association of Bay Area Governments (ABAG) *Projections 2013, Subregional Study Area Table*.

As part of the environmental review process required by the California Environmental Quality Act (CEQA) a determination must be made as to whether the project would not be adequately served by existing library facilities thus requiring the construction of new facility or improvements to an existing facility that would result in a physical impact to the environment.

Below is an excerpt from Existing Conditions Reports that were released for public review in January 2015, including the information regarding library services in the City, followed by several questions. Because the information included in the Existing Conditions Reports was gathered last year, information regarding library operations (i.e. staffing levels, budget, and collection information) may no longer reflect current existing conditions. Your input in confirming and/or updating the information below will help us to complete our environmental review and to make a determination of whether or not a significant environmental impact could occur as a result of the adoption of the proposed Project, pursuant to State CEQA Guidelines.

The General Plan Update and Zoning Ordinance Update that are the subject of this EIR consist of long-term plans that will be implemented as policy documents guiding future development activities and City actions through the year 2040. Because this is a program-level EIR, this document does not evaluate the impacts of specific, individual developments that may be allowed under the General Plan. Future specific projects may require separate environmental review.

To determine whether the proposed project would have the potential to have a significant environmental effect related to **library services**, the Draft Environmental Impact Report (Draft EIR) being prepared for the proposed project applies the following standard of significance:

> *Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for library services?*

The purpose of the Draft EIR is to assess the project's potential impacts to various environmental issue areas and public service and utility agencies, including the City of Menlo Park's Library

System. The Draft EIR will also provide recommendations that may be necessary to reduce such potential impacts to "less-than-significant" levels.

Below are excerpts from the 2015 Existing Conditions Report for the Project. Please confirm the information, and any assistance that you can provide with the questions that follow would be greatly appreciated.

LIBRARY

Menlo Park libraries are part of the Peninsula Library System, a regional library cooperative which offers access to a wide variety of materials and databases shared by member libraries. Menlo Park operates two libraries that provide a diversity of services to Menlo Park residents and visitors. The Menlo Park Main Library is a 34,200-square-foot building located at 800 Alma Street in the Menlo Park Civic Center. The Main Library has a collection of 200,000 plus items, and offers a variety of spaces, services, and equipment. Equipment includes 17 computers for adult use with internet and office software, nine computers dedicated to children's use (three of which include literacy software), a paired computer and flatbed scanner, Scanning and Reading Appliance (SARA), two printers, and a copier. Main library services include free wireless internet access, book borrowing, eBooks, eMagazines, database access, and a wide variety of programs for children and adults such as seven weekly storytimes for children and a monthly program for adults on Saturday, and special programs throughout the year. The library also has an active program for teenagers, including a teen advisory group, reading club, and special activities. As of this writing, the Main Library is open seven days a week, but is closed during federal holidays.

In 1999, the City opened a 3,600-square-foot branch library in the Belle Haven Elementary School at 413 Ivy Drive as part of a joint venture with Ravenswood City School District. The Belle Haven Branch offers a variety of services and equipment. The Belle Haven Library provides 13 computer terminals for public use, with an additional two catalog computers. The publically accessible computers feature full internet access, as well as office software, with several of the computers featuring English language learning software and educational children's computer games. The library also features a copy machine, and includes services such as free wireless internet access, book borrowing, eBooks, eMagazines and database access. The Belle Haven Branch is the site for English as a Second Language (ESL) classes through the library's Adult Literacy Program and also has a weekly storytime for children. The library is open five days a week, Tuesday through Saturday. The Belle Haven Library has a collection of 21,000 items, of which 30 percent are in Spanish language.

1. According to the Menlo Park General Plan, the Menlo Park Library has a goal to maintain a ratio of 3.29 books per capita and a ratio of 1.02 square feet of library space per capita. Is the Menlo Park Library System currently meeting this goal? What assumptions are made when calculating service needs and how are service needs calculated?

2. Does the library have capacity to serve additional demand resulting from buildout of the Project?
3. Would the City of Menlo Park Libraries need to construct new library facilities or expand existing facilities in order to accommodate the project's demand for library services?

4. What is the funding program for the library system?

5. Does the library have identified Developer Impact Fees for the commercial and/or residential development in Menlo Park? If so, please describe the fees.

6. Are there any existing deficiencies, such as need for new facilities/staff, lack of funding?

7. What are the existing staff levels at the Menlo Park Libraries and are the existing staff levels at the library(s) adequate to meet current demands for the population in the project areas?

8. How many books do the Main Library and Belle Haven Library currently have?

9. Are the equipment levels adequate to meet the project area's current demand for library services?

10. Are there any plans for expansion or relocation of these library(s) that would serve the project? If so, please describe the expansion or relocation.

11. Please provide recommendations that could reduce the demand for library services created by the proposed project.

12. Are there any current documents on library service in the City including background reports, policy documents, and facility plans that you think would help with preparing the environmental review analysis for impacts to library services as a result of the proposed project?

If you have any questions, please feel free to contact me at 510.848.3815.

Sincerely,

Ricky Caperton

Placeworks Questions for Library

1) The figure quoted from the General Plan is a new one for me. There is no national or state standard for books or library square footage per capita so I don't know how this number was derived. As the current General Plan is very old, 1994, it represents library collections in books only. We now have a broader definition of collections and count books, DVDs, CDs, electronic databases, e-books and e-magazines as our collections. The updated General Plan should also address more than books.
2) No, the current library located at the Belle Haven Elementary School is not capable of servicing a large increase in population in the Bayfront area. It is already built out with its current collections and would have no room to add additional materials or workspace to serve the additional population.
3) Yes, a new library in Belle Haven would need to be constructed. The current library is in a building owned by the Ravenswood City School District so the city could not expand or modify that space without permission of the District. The physical location of the library, near the center of the community, is good but the location on an elementary school campus is not the best for a growing community.
4) City General Fund is the primary resource for library funding.
5) No, not to my knowledge.
6) Yes, the Main Library's last addition dates to 1990 and the earliest part of the building to 1960. The building no longer functions as a 21century library. A space needs study will take place in 2016. The Belle Haven Branch Library is not a city building so no additions or changes can be made to it. Both libraries suffer from staff reductions which date back to the recession years.
7) There are currently 14 FTE staff representing 19 employees (7 fulltime, 12 part-time) plus 36 temporary employees. They staff a Main Library open 59 hours per week and the Belle Haven Branch open 32 hours per week.
   Staffing levels at the Branch are sufficient to meet current schedule of open hours and activity.
8) Books Total Held as of June 30, 2014 165,659
   Electronic Books 46,524
   Total Physical Audio Materials 17,091
   Total Online Audio Materials 2,815
   Total Physical Video Materials 16,762
   Number of Current Print Serial Subscriptions 210
   Total Number of Volumes Held by Branch *20,474*
9) Yes, for current demand.
10) There are no current plans for expansion or relocation of the Belle Haven Branch Library.
11) It's not the role of the library to try and reduce demand for our services. Our role is to identify and provide new ways to meet growing demands for our services. We would not discourage growth in demand for library service.
12) Nothing that would relate to the impact to library services in the proposed project area.

1 INTRODUCTION

Erler and Kalinowski, Inc. ("EKI") is pleased to present this water supply evaluation study ("WSE Study") in support of the proposed update to the Menlo Park General Plan Land Use & Circulation Elements and the M-2 Area Zoning, collectively known as "ConnectMenlo," for the City of Menlo Park, California (the "City"; see Figure 1).

The City's current General Plan Land Use and Circulation Elements were last updated in 1994 and include outdated land use and traffic projections. The purpose of ConnectMenlo is to update the Land Use and Circulation Elements of the City's General Plan, with a particular geographical focus on the Bayfront Area (also known as the "M-2 Zoning Area"; see Figure 2), and to update the zoning provisions to reflect the proposed land use changes within the Bayfront Area. These updates to the General Plan are being analyzed in the ConnectMenlo Program Environmental Impact Report ("PEIR"; PlaceWorks, 2015).

Changes in land use within the Bayfront Area are the subject of this WSE Study. For the purposes of this WSE Study and per the PEIR, the "proposed Project" includes a maximum potential net increase in new development north of Highway 101 in the Bayfront Area of approximately:

- 2.3 million non-residential square feet, including offices, life-sciences buildings, and other commercial uses;
- 400 hotel rooms;
- 4,500 multi-family residential units;
- Two transit centers; and
- Up to 61 acres of landscaped open space.

As described in Section 2, a Water Supply Assessment ("WSA") is not required for the proposed Project pursuant to the California Water Code ("CWC" or "Water Code") §10910-10915. However, for informational purposes, specifically with respect to the proposed changes to the Bayfront Area, the City has voluntarily elected to prepare a WSE Study for the proposed Project that is modeled after, and in general conformance with, WSA requirements and the information requested within the California Department of Water Resource's ("DWR's") *Guidebook for Implementation of Senate Bill 610 and Senate Bill 221 of 2001: To Assist Water Suppliers, Cities, and Counties in Integrating Water and Land Use Planning*, dated 8 October 2003. The text of specific sub-sections of the Water Code is included in indented and italicized font at the beginning of specific sections of this WSE Study. The information presented in those respective sections, and the associated tables and figures, respond directly to Water Code requirements.

Water service within the Bayfront Area is provided by the Menlo Park Municipal Water District ("MPMWD")[1]. The purpose of this WSE Study is to evaluate whether the MPMWD has sufficient water supply to meet the current and planned water demands within its service area, including the demands associated with the proposed Project, during normal and dry hydrologic years over a 20-year time horizon. More specifically, this WSE Study includes:

- A summary of the WSA requirements articulated in Water Code §10910-10915 and a description of how they have been addressed in the WSE Study prepared for the proposed Project;
- A description and analysis of the current and projected future water demands of the proposed Project through the year 2040;
- A description and analysis of the historical, current, and projected future water demands for the MPMWD service area through the year 2040;
- A description and analysis of the current and projected future water supplies for the MPMWD service area through the year 2040; and
- A comparison of the water supplies and demands for MPMWD's water service area, including the projected water demands associated with the proposed Project.

The information contained in this WSE Study is based primarily on MPMWD's 2010 Urban Water Management Plan ("UWMP"), MPMWD's draft 2015 UWMP (which is in development), information provided by the City staff, and information specific to the proposed Project (i.e., square footage of specific land uses; PlaceWorks, 2015).

This WSE Study has been prepared for the sole use and benefit of the City of Menlo Park and MPMWD. Unless specifically authorized in writing in an agreement acceptable to EKI, reliance on this WSE Study by any other entity or third party is not permitted or authorized.

[1] A portion of the Bayfront Area bounded by Highway 101, Marsh Road, and the Dumbarton Rail is served by California Water Service Company. The proposed land use changes in this area would generally reflect the same uses and intensity that is permitted under the current regulations.

2 GENERAL REQUIREMENTS FOR THE PREPARATION OF A WATER SUPPLY ASSESSMENT

The purpose of this section is to outline what types of projects require WSAs, who is responsible for their preparation, and the necessary components of a WSA.

2.1 APPLICABILITY OF SENATE BILL 610 TO THE PROJECT

Water Code Section 10910

(a) Any city or county that determines that a project, as defined in Section 10912, is subject to the California Environmental Quality Act (Division 13 (commencing with Section 21000) of the Public Resources Code) under Section 21080 of the Public Resources Code shall comply with this part.

Water Code Section 10912

For the purposes of this part, the following terms have the following meanings:

(a) "Project" means any of the following:
- *(1) A proposed residential development of more than 500 dwelling units.*
- *(2) A proposed shopping center or business establishment employing more than 1,000 persons or having more than 500,000 square feet of floor space.*
- *(3) A proposed commercial office building employing more than 1,000 persons or having more than 250,000 square feet of floor space.*
- *(4) A proposed hotel or motel, or both, having more than 500 rooms.*
- *(5) A proposed industrial, manufacturing, or processing plant, or industrial park planned to house more than 1,000 persons, occupying more than 40 acres of land, or having more than 650,000 square feet of floor area.*
- *(6) A mixed-use project that includes one or more of the projects specified in this subdivision.*
- *(7) A project that would demand an amount of water equivalent to, or greater than, the amount of water required by a 500 dwelling unit project.*

As described in Section 1, the proposed Project includes an update to the City's current General Plan that would allow a net increase in allowable new development in the Bayfront Area. As such, this Project does not strictly meet the project definitions included in Water Code §10910(a) and 10912(a)(3). However, the City has determined that the proposed Project is subject to the California Environmental Quality Act ("CEQA") and is voluntarily preparing a WSE Study evaluation as part of the PEIR that is modeled after, and in conformance with, all WSA requirements.

2.2 RESPONSIBILITY FOR PREPARATION OF THE WSA

Water Code Section 10910

(b) The city or county, at the time that it determines whether an environmental impact report, a negative declaration, or a mitigated negative declaration is required for any project subject to the California Environmental Quality Act pursuant to Section 21080.1 of the Public Resources Code, shall identify any water system that is, or may become as a result of supplying water to the project identified pursuant to this subdivision, a public water system, as defined in Section 10912, that may supply water for the project. If the city or county is not able to identify any public water system that

may supply water for the project, the city or county shall prepare the water assessment required by this part after consulting with any entity serving domestic water supplies whose service area includes the project site, the local agency formation commission, and any public water system adjacent to the project site.

Water for the proposed Project will be supplied by the MPMWD public water system and therefore, in accordance with Water Code §10910(b), the City would be the entity responsible for completing a Project-specific WSA. However, as noted previously, a WSA is not required for the proposed Project by the Water Code. However, the City voluntarily elected to prepare this WSE Study for the proposed Project that is modeled after, and in conformance with, all WSA requirements.

2.3 COMPONENTS OF A WATER SUPPLY ASSESSMENT

Water Code Section 10910

(c) (4) If the city or county is required to comply with this part pursuant to subdivision (b), the water supply assessment for the project shall include a discussion with regard to whether the total projected water supplies, determined to be available by the city or county for the project during normal, single dry, and multiple dry water years during a 20-year projection, will meet the projected water demand associated with the proposed project, in addition to existing and planned future uses, including agricultural and manufacturing uses.

As listed above in Water Code §10910(c)(4), the primary purpose of a WSA is to evaluate whether sufficient water supply is available to meet all future demands within the water supplier's service area, including those associated with the proposed Project, during normal and dry hydrologic years for a 20-year time horizon. In order to complete an equivalent assessment, the following information is included in this WSE Study:

- A description and analysis of the current and projected future water demands of the proposed Project through the year 2040;
- A description and analysis of the historical, current, and projected future water demands for the MPMWD service area through the year 2040;
- A description and analysis of the current and projected future water supplies for the MPMWD service area through the year 2040; and
- A comparison of the water supplies and demands for MPMWD's water service area, including the projected water demands associated with the proposed Project.

3 PROJECT DESCRIPTION

The Bayfront Area is located in the northern-most portion of the City of Menlo Park (Figure 1). Water service within the Bayfront Area is provided by MPMWD[2]. Other water suppliers within the City of Menlo Park include California Water Service Company - Bear Gulch District, O'Connor Tract Co-Operative Water Company, and Palo Alto Park Mutual Water Company.

Current land uses within the Bayfront Area include industrial and business park uses. Figure 2 shows the location of the Bayfront Area, which is generally bounded by San Francisco Bay to the north; Redwood City to the west; East Palo Alto to the southeast; and the Menlo Park neighborhoods of Belle Haven, Flood Triangle, Suburban Park, and Lorelei Manor to the south. Existing water use within the Bayfront Area is associated with office- and industrial-type activities (e.g., restrooms, process, cooling, and landscape irrigation). The proposed Project's future water demand will reflect a mixed land use and be associated with residential and commercial activities.

The proposed Project includes a maximum potential net increase in new development north of Highway 101 within the Bayfront Area of approximately:

- 2.3 million non-residential square feet, including offices, life-sciences buildings, and other commercial uses;
- 400 hotel rooms;
- 4,500 multi-family residential units;
- Two transit centers; and
- Up to 61 acres of landscaped open space[3].

As above, as part of the increase in new development, the proposed Project is anticipated to add 61 acres of landscaped open space to the Bayfront Area. Approximately 15 acres of landscaped area will be within residential lots and the remaining 46 acres of landscaped area will be dedicated to non-residential land uses including the commercial land uses, transit centers, and open space areas. However, it is noted that the City is currently in the process of drafting new zoning regulations for the Bayfront Area that may reduce the minimum required open space area in residential lots from what was analyzed, thus reducing the outdoor water demand associated with the proposed Project.

Project buildout is planned over a 25-year horizon through 2040. Water demands associated with the proposed Project are anticipated to increase in phase-specific increments between 2020 and

---

[2] A portion of the Bayfront Area bounded by Highway 101, Marsh Road, and the Dumbarton Rail is served by California Water Service Company. The proposed land use changes in this area would generally reflect the same uses and intensity that is permitted under the current regulations.

[3] Information regarding landscaped areas within the proposed Project was provided by PlaceWorks on 13 August 2015.

2040. This WSE Study presents water demands for the proposed Project at buildout and at intermediate phases of development.

4 HISTORICAL AND CURRENT WATER USE WITHIN THE BAYFRONT AREA

Water use at each existing account within the Bayfront Area is metered and recorded by MPMWD on a monthly basis. Water use data for the period from April 2010 through December 2014 for the active water accounts within the Bayfront Area were provided by the City on 15 and 24 September 2015. A summary of the total historical water use for the Bayfront Area is included in Table 1.

Average annual water use within the Bayfront Area from 2010 through 2014 was approximately 195 million gallons ("MG"), with annual water use ranging from 162 MG in 2012 to 224 MG in 2010. The trends observed in historical water use within the Bayfront Area are generally consistent with those observed throughout MPMWD's service area, as discussed in Section 6.3, and likely reflect the influence of the recent droughts and vacancies in this area during the economic downturn.

It is expected that some or all of the existing demand within the Bayfront Area will be subsumed as part of the redevelopment plan for this area, as actual buildout of the proposed Project may replace some existing land uses. However, since the exact nature and location of the future development is unknown (i.e., whether it will add to or replace the existing land uses) we have conservatively assumed that all demands associated with the proposed Project are additive to the existing demands.

5 PROJECT WATER DEMAND

The City requires that all new residential and non-residential construction comply with the mandatory CALGreen Requirements.[4] The City also requires that new and rehabilitated landscapes on projects subject to city review and approval comply with the City's Water Efficient Landscaping Ordinance ("Landscaping Ordinance"), which was updated on 26 January 2016 to reflect recent changes to the State's Model Water Efficient Landscape Ordinance ("MWELO"; DWR, 2015). As such, at a minimum, future developments within the Bayfront Area are expected to include a number of water-efficiency features, including, but not limited to:

- Use of low-flow lavatory faucets, kitchen faucets, toilets, and urinals in accordance with CALGreen Code; and
- Inclusion of low-water use landscaping and high-efficiency irrigation systems to minimize outdoor water use in accordance with the Landscaping Ordinance.

In addition, the City is considering the adoption of recycled water requirements as part of new projects that meet certain criteria and are within the M 2 Zoning (Bayfront) Area. As part of the proposed Menlo Park General Plan Land Use & Circulation Elements and the M-2 Area Zoning Update, several new zoning district categories, including Office ("O"), Life Science ("LS"), and Mixed Use Residential ("MU-R"), are being proposed to the General Plan land use designations. Corresponding zoning district regulations could potentially include requirements for recycled water use, such as provide dual plumbing, use recycled water for landscape irrigation, and / or evaluate alternative water sources, including on-site recycling, for toilet and cooling water uses.

As described below, the proposed Project's average annual water use was estimated based on: (1) the application of well-established methodologies for estimating indoor and outdoor water use, and (2) assumptions regarding water efficiency for certain end uses based on conformance with the City requirements described above. As shown in Table 2, the annual water use associated with the proposed Project is conservatively estimated to be 343 MG at buildout.

5.1 RESIDENTIAL WATER USE

5.1.1 Residential Indoor Water Use Factors

The residential indoor water use factors were developed using a predictive model of residential water use developed for the United States Environmental Protection Agency ("U.S. EPA") and several large water utilities (DeOreo, 2011). The U.S. EPA model is based on residential indoor water use data collected over the years 2006 through 2010 at 300 single family homes[5] constructed since 2001 in nine American cities, including one city in California.

---

[4] As described on the City's website: http://www.menlopark.org/DocumentCenter/Home/View/93

[5] End uses for indoor water use in single family homes are similar to those in multi-family homes, so we have assumed that the formulas developed in this study also apply to multi-family homes.

Because the U.S. EPA model reflects actual water use patterns observed in recently-constructed and occupied homes, it represents a sound basis for predicting indoor water use in new developments, which would be required to meet even higher standards of efficiency such as the CALGreen Code. The results of this model also compare well with recent residential per capita data being published for similar communities throughout California by the State Water Resources Control Board ("SWRCB", 2015) and residential water use factors within other Bay Area Water Supply and Conservation Agency ("BAWSCA") cities (BAWSCA, 2014a).

The U.S. EPA predictive model allows the projected total residential indoor use to be calculated from these demographic and water conservation inputs:

$$\text{INDOOR} = [71.2 \times \text{RESIDENTS}^{0.63} \times (1 + 0.91 \times \text{LEAK}) \times (1 - 0.23 \times \text{H.EFF.CW}) \times (1 + 0.12 \times \text{SOFTENER})] + 11.8$$

where:

INDOOR =	indoor water use in gallons per home per day
RESIDENTS =	number of residents in household
LEAK =	the fraction of homes with a significant leak greater than 50 gallons per day
H.EFF.CW =	the fraction of homes with a high-efficiency clothes washer that uses less than 30 gallons per load
SOFTENER =	the fraction of homes with a water softening system

Residential indoor water use factors were developed using the above model to reflect the proposed Project's water efficiency design standards and based the following assumptions:

- Home water softening systems (e.g., regenerating ion exchange units or reverse osmosis units) are not installed.
- A total of 75% of clothes washers installed in residential units would use less than 30 gallons per load.[6]
- Leaks greater than 50 gallons per day would occur in at most 9% of the residential units, which represents a conservative assumption (i.e., likely higher than would actually be encountered based on empirical data from existing residential developments; DeOreo, 2011).
- Based on the planned population and residential units of the proposed Project, the average household size is assumed to be 2.57 people (PlaceWorks, 2015).

[6] For context, approximately 39% of existing homes in the United States have clothes washers that use less than 30 gallons per load (DeOreo, 2011) and the majority of commercially-available home washing machines today use under 30 gallons per load.

Based on the above methodology and assumptions, indoor water use for each residential unit is estimated to be 127 gallons per day. Annual indoor water use for residential land use is estimated to be 209 MG, or 49.4 gallons per capita per day ("GPCD"). The estimated indoor residential water use calculations are shown in Table 3a.

5.1.2 Residential Outdoor Water Use Factors

The outdoor water use factors were estimated using the landscape irrigation demand model described in the recently-updated MWELO (DWR, 2015), which the City recently adopted and is implementing as part of its Landscaping Ordinance. The MWELO requires that the annual estimated total water use for landscape irrigation not exceed the Maximum Applied Water Allowance ("MAWA"). As shown below, the MAWA is calculated based on the regional reference evapotranspiration rate, an evaporation adjustment factor, the total landscaped area, and the area of "special landscaped area".[7] For the proposed Project we have conservatively assumed that outdoor water use will be equal to the MAWA, which is the upper limit of annual applied water for the established landscaped area. For the residential portion of the proposed Project, it was assumed that a total of 15 acres would be irrigated (PlaceWorks, 2015[8]).

The MAWA is calculated using the following equation:

$$MAWA = ETo \times [(ETAF \text{ x } LA) + (1 - ETAF) \times SLA]$$

where:

ETo	=	The regional reference evapotranspiration rate[9]
ETAF	=	Evapotranspiration Adjustment Factor
	=	For residential areas = 0.55
	=	For non-residential areas = 0.45
LA	=	Total landscape area (including SLA)
SLA	=	Special Landscape Area

Based on the above methodology and assumptions, outdoor water use for residential units is estimated to be 10 MG per year, or 2.3 GPCD. The estimated outdoor residential water use calculations are shown in Table 4. However, it is noted that the City is currently in the process of

[7] Special Landscaped Area includes landscaping dedicated solely to edible plants, recreational areas, areas irrigated with recycled water, or water features using recycled water. No Special Landscaped Area is included in the proposed Project.

[8] Information regarding landscaped areas within the proposed Project was provided by PlaceWorks on 13 August 2015.

[9] Location-specific reference evapotranspiration ("ETo") data is required for calculating the the MAWA. Reference evapotranspiration data were obtained from Appendix A of the MWELO (DWR, 2015) based on values for Redwood City, which is the closest available City to the Bayfront Area. The total annual reference evapotranspiration is 42.8 inches as shown in Table 4.

drafting new zoning regulations for the Bayfront Area that may reduce the minimum required open space area in residential lots from what was analyzed, thus reducing the outdoor water demand associated with the proposed Project.

5.1.3 Total Residential Water Use

As shown in Table 2, based on the current land use assumptions, the total annual residential water use at Project buildout is estimated to be 219 MG, or 52 GPCD.

5.2 COMMERCIAL, INSTITUTIONAL, AND INDUSTRIAL WATER USE

5.2.1 Commercial, Institutional, and Industrial Indoor Water Use Factors

The Commercial, Institutional, and Industrial ("CII") indoor water use factors were developed using the data and methodology included in the Pacific Institute's *Waste Not, Want Not: The Potential for Urban Water Conservation in California* (2003), also referred to as the "Pacific Institute Study". This study developed indoor "employee water use factors" for wide range of commercial and industrial facilities based on statewide averages of (1) measured water use data, and (2) the number of employees for each type of facility. To account for implementation of more-stringent water efficiency standards since the study was completed, and the anticipated water-efficient design of the proposed Project, the "best" potential "conservation saving factors"[10] estimated in Appendices E and F of the Pacific Institute Study were applied to the employee water use factors. For reference, additional detail regarding the derivation of the Pacific Institute's water conservation factors is included in Appendix A to this WSE Study.

The CII indoor water use factors for the proposed Project were estimated for the assumed mix of specific CII land uses that are contemplated in the Bayfront Area, including office space, life science buildings, hotels and other commercial space.

Table 3b summarizes the CII land use parameters that were used to estimate the CII indoor water use factors. Each of these parameters is discussed in the following sections.

Number of Employees

The number of employees for office and hotel land use as shown in Table 3b for the proposed Project was based on information provided by City staff on 20 November 2015. The number of employees for life science buildings and other commercial land uses was estimated using the

[10] As shown in Appendix A, the Pacific Institute Study presented conservation saving factors for "high," "low," and "best" potential savings for each type of land use, and for specific end-uses. According to the Pacific Institute, the "best" potential conservation saving factors represent the most accurate estimate of likely conservation potential based on the source of the data, age of the data, and/or sample size.

average number of employees per floor area by CII category reported by the Federal Energy Information Administration in a 2006 study (EIA, 2006).[11]

Employee Indoor Water Use Factors

The employee water use factors discussed in the Pacific Institute Study identified the average indoor water consumption per employee per working day for each type of CII land use and normalized for a 225-day work year. For example, if the applicable employee water use factor is 100 gallons per employee per work day, each employee within the applicable CII land use category would consume 225 multiplied by 100, or 22,500 gallons per year.

It should be noted that the employee water use factors were derived from the Pacific Institute Study for comparable facilities based on water use data collected during or prior to the year 2000.[12] The water use efficiency for new commercial construction has generally improved since this these data was were collected. As a result, the employee water use factors developed as part of the Pacific Institute Study provide a conservative (i.e., high) estimate of CII water use for new buildings, a fact that was anticipated in the study and addressed through the development of conservation savings estimates, as discussed below.

Conservation Savings

The Pacific Institute Study was based on water use data that predated the adoption of the current CALGreen Code and other applicable water efficiency standards. Anticipating improved future water-efficiency, the Pacific Institute Study developed conservation saving factors, which can be applied to the employee water use factors to account for the implementation of more-stringent water efficiency standards. Specifically, the Pacific Institute Study estimated that the implementation of water conservation measures, such as those required by the current CALGreen Code and similar regulations, could reduce water demands by 26% to 42% compared with the water use factors developed in their study, depending on the conservation scenario, land use type, and type of water fixture or appliance. The water conservation measures accounted for in the Pacific Institute Study that would be implemented by the proposed Project include:

---

[11] The Commercial Buildings Energy Consumption Survey is a comprehensive national survey that collects information on the stock of U.S. commercial buildings, including their energy-related building characteristics, energy usage data, and how many employees there are per square foot for different CII land uses.

[12] According to the Pacific Institute study (2003), CII employee water use factors were estimated from data gathered from CII water users around California in several surveys (DWR, 1995 and 2000; Davis et al., 1988; Dziegielewski et al., 1990; and Dziegielewski et al., 2000). To estimate statewide CII water use, these employee water use coefficients were then applied to statewide employment data to project the total water use for each sector. These estimated water usages were then compared with water-delivery data by sector, as reported by nearly 150 water districts across the state. The difference between CII water use estimates developed using these two methods was less than 10%.

- Installation of ultra-low flush toilets and urinals, plus low-flow faucet aerators and showerheads[13];
- Improvements to mechanical cooling systems by installation of conductivity controllers, addition of chemical treatments to improve the concentration ratio, and improved energy efficiency of other mechanical components; and
- Other technologies appropriate for kitchens, laundries, and industrial processes such as water-efficient dishwashers and washing machines and industrial water reuse.

Based on assumed implementation of these water-efficiency measures within the proposed Project, conservation saving factors for indoor water uses were estimated based on the "best" potential savings[14] identified in the Pacific Institute Study, as shown in Appendix A. These estimated conservation saving factors were incorporated into the proposed Project demand calculations for all CII categories, as shown in Table 3b.

However, it should be noted that these conservation savings factors do not directly account for the water savings associated with use of high-efficiency toilets required by the CALGreen Code (i.e., those that use 1.28 gallons per flush or less), or the increased efficiency of other water fixtures relative to the assumptions imbedded in the Pacific Institute Study. Nor do they account for the potential conversion of the proposed Project's landscape irrigation or other non-potable demands to recycled water, or other non-potable sources. As such, to the extent that actual water use at the proposed Project is less than what has been conservatively estimated herein (for the reasons stated above, or other reasons), the resultant impacts to MPMWD's water supply and demand projections (as discussed in Sections 5 and 6), will likewise be reduced.

5.2.2 Transit Centers

Indoor water use for the proposed transit centers is calculated separately from other CII land uses based on an end-use approach. The end-use approach assumes that indoor water uses in the transit centers are only associated with restroom visits and that restroom fixture efficiencies meet CALGreen requirements.

The estimated transit center indoor water use calculations are shown in Table 3c.

---

[13] Effective January 2014, only high-efficiency toilets that use 1.28 gallons per flush will be available for purchase in California. The water savings estimates assumed in the Pacific Institute study only reflected installation of 1.6 gallon per flush toilets. Therefore, these CII conservation savings estimates may be conservative (i.e., underestimate the water savings potential).

[14] As shown in Appendix A, the Pacific Institute Study presented conservation saving factors for "high," "low," and "best" potential savings for each type of land use, and for specific end-uses. According to the Pacific Institute, the "best" potential conservation saving factors represent the most accurate estimate of likely conservation potential based on the source of the data, age of the data, and/or sample size.

5.2.3 Commercial, Institutional, and Industrial Outdoor Water Use Factors

As with the residential elements of the proposed Project, the CII outdoor water use factors were estimated using the landscape irrigation demand model described in the recently-updated MWELO (DWR, 2015), which the City has adopted and is implementing as part of its Landscaping Ordinance. For the proposed Project we have conservatively assumed that outdoor water use will be equal to the MAWA, which is the upper limit of annual applied water for the established landscaped area, which was estimated to be 46 acres (PlaceWorks, 2015). The estimated outdoor water demand calculations are shown in Table 4.

5.2.4 Total Commercial, Institutional, and Industrial Water Use

Based on the above methodologies and assumptions, the estimated annual total CII water use at Project buildout is estimated to be 124 MG, as shown in Table 2.

6 MPMWD WATER DEMAND

Water Code Section 10910

(c) (1) The city or county, at the time it makes the determination required under Section 21080.1 of the Public Resources Code, shall request each public water system identified pursuant to subdivision (b) to determine whether the projected water demand associated with a proposed project was included as part of the most recently adopted urban water management plan adopted pursuant to Part 2.6 (commencing with Section 10610).

(c) (2) If the projected water demand associated with the proposed project was accounted for in the most recently adopted urban water management plan, the public water system may incorporate the requested information from the urban water management plan in preparing the elements of the assessment required to comply with subdivisions (d), (e), (f), and (g).

(c) (3) If the projected water demand associated with the proposed project was not accounted for in the most recently adopted urban water management plan, or the public water system has no urban water management plan, the water supply assessment for the project shall include a discussion with regard to whether the public water system's total projected water supplies available during normal, single dry, and multiple dry water years during a 20-year projection will meet the projected water demand associated with the proposed project, in addition to the public water system's existing and planned future uses, including agricultural and manufacturing uses.

As part of the development of its 2015 UWMP, the City has estimated the current and projected future water demand for MPMWD water system service area based on buildout of the City's current General Plan and approved projects. In accordance with the UWMP Act (Water Code §10610-10656), MPMWD's projected future water demand is estimated in five year increments, between the years 2015 and 2040, and is subdivided between the following six customer sectors: (1) residential single family, (2) residential multi-family, (3) commercial and institutional, (4) industrial, (5) landscape, and (6) other.[15]

The proposed Project was not accounted for in the water demand projections of the current General Plan buildout. Therefore, although the proposed Project will likely supplant some existing demands within the Bayfront Area, we have considered the demand attributed to the proposed Project to be wholly additive to the current water demands (i.e., to existing conditions) and have conducted our analysis accordingly.

6.1 HISTORICAL AND CURRENT USE WITHIN THE MPMWD SERVICE AREA

Water use within the MPMWD service area is measured using water meters that are installed at each customer account and is summarized in Table 5. Records of current and historical water use at each account are maintained by the City Public Works Department. According to information provided by City staff on 30 September 2015, total annual water use for MPMWD was approximately 1,030 MG in 2014, which was a decrease relative to 2013 and a departure from the increase in water use observed between 2011 and 2013. Prior to 2011, water use had decreased

[15] System water loss is also included in the future water demand listed in the UWMP (Menlo Park, 2015). Losses were assumed to be approximately 4.5 percent of the total system water use.

since 2007; this decrease is thought to reflect impacts of the 2007-2009 drought and the economic downturn that resulted in lower residential and non-residential water use. The rebound in water use in 2011 and 2013 are thought to reflect improved economic conditions. Despite the economic rebound in the Bay Area, the resultant calls for water use cutbacks locally and mandatory state-wide restrictions[16] in response to the recent historic drought led to another decline in water use in 2014.

6.2 POPULATION AND EMPLOYMENT PROJECTIONS

Future water demands for MPMWD's service area were projected by BAWSCA on behalf of MPMWD in the 2014 *Regional Water Demand and Conservation Projections Report* (BAWSCA, 2014b). Future water demands were projected using the Demand Management Decision Support System Model ("DSS Model") and based on population and employment projections within MPMWD's service area, which were in turn developed using Association of Bay Area Governments ("ABAG") 2013 data.

In 2015, MPMWD's DSS Model was revised to account for several changes since the demand projections completed by BAWSCA. The 2015 DSS Model update includes revised population and employment projections developed by the City's Planning Division based on information related to the City's recently-approved projects and the current General Plan.

Specifically, future population within MPMWD's water service area is projected within the draft 2015 UWMP and 2015 DSS Model based on buildout of the current General Plan. The current General Plan estimates that there will be 18,614 residents within MPMWD's service area in 2040, an increase of 2,548 relative to the current 2015 population of 16,066.

The MPMWD also supplies water to its CII customers, which were collectively estimated to provide 12,443 jobs within MWMPD's water service area in 2015. Based on the current General Plan and the City's approved projects, the number of jobs within MWMPD is anticipated to grow to 17,143 in 2020, and to 20,543 in 2040. Anticipated job growth within MPMWD is a combined effect of growth in the commercial sector and decline in the industrial sector. Specifically, commercial jobs are expected to increase by 8,796 while industrial jobs are expected to decrease by 696 between 2015 and 2040 (Menlo Park, 2015b).

6.3 WATER DEMAND PROJECTIONS - CURRENT GENERAL PLAN BUILDOUT

The projected future water demand within MPMWD's service area was reported in the draft 2015 UWMP, and is summarized below and in Table 6. As described above, projected water demand

---

[16] On 28 July 2014, the SWRCB adopted emergency regulations to mandate water agencies, including the MPMWD, to implement their Water Shortage Contingency Plan and minimum actions to reduce outdoor water use. On 5 May 2015, SWRCB adopted Resolution 2015-0032 to mandate further minimum actions by water suppliers and their customers to reduce potable water use into 2016 and assigns a mandatory water conservation savings goal to each water supplier based on their residential water use. MPMWD has a SWRCB-mandated reduction target of 16%.

within the MPMWD service area is the sum of water use in each sector and water that is projected to be lost during distribution ("system losses" or "non-revenue water").

Projected water demands within MPMWD are provided in Table 6 in five-year increments for 2020 through 2040. It is estimated that annual water demands associated with the City's current General Plan buildout are approximately 1,310 MG in 2020 and 1,240 MG in 2040. The anticipated decline in water demands between 2020 and 2040 in spite of growth in total population and jobs is largely due to:

- Decreasing projected water use in the industrial sector; and
- Increased water efficiency in the residential and non-residential sectors as a result of plumbing code changes and planned MPMWD conservation efforts.

6.4 OTHER PLANNED PROJECTS WITHIN MPMWD'S WATER SERVICE AREA

Table 7 identifies other planned projects within MPMWD's water service area that are included in the draft 2015 UWMP and the 2015 DSS Model. These projects were identified on the basis of information provided by the City's Planning Division.[17]

There are two projects that are pending City's approval that are not accounted for in the water demand projections of the City's current General Plan buildout or in the 2015 DSS Model. These projects and their potential annual water demands are included in Table 7. The total annual demand of these projects is approximately 31 MG.

6.5 TOTAL PROJECTED MPMWD WATER DEMAND

Total projected MPMWD water demand, as shown in Table 8, is the sum of water demands associated with the City's current General Plan buildout (i.e., as reflected in the 2015 DSS Model), the planned projects within the MPMWD service area in addition to the current General Plan, and the proposed Project. It is estimated that annual water demand will be approximately 1,271 MG in 2040 within MPMWD's service area (i.e., 1,240 MG for buildout of the current General Plan plus 31 MG for other planned projects), excluding the proposed Project. Including the estimated water demand for the proposed Project (i.e., 343 MG per year), approximately 1,614 MG of water demand is expected in 2040 within MPMWD's service area.

[17] Projects were identified from the City of Menlo Park Planning Division on 9 September 2015.

7 MPMWD SUPPLY

This section identifies MPMWD's water supplies and discusses the vulnerability of the various supplies to drought and other factors affecting water reliability.

7.1 IDENTIFICATION OF WATER SUPPLY RIGHTS

Water Code Section 10910

(d) (1) The assessment required by this section shall include an identification of any existing water supply entitlements, water rights, or water service contracts relevant to the identified water supply for the proposed project, and a description of the quantities of water received in prior years by the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), under the existing water supply entitlements, water rights, or water service contracts.

Pursuant to Water Code §10910(d)(1), a WSA is required to include identification of all water supply entitlements, water rights, and water service contracts relevant to the identified water supply for the Project. In accordance with these requirements, this WSE Study includes a summary of MPMWD's water supply sources and the agreements between MPMWD and its wholesale supplier.

7.1.1 SFPUC Regional Water System

MPMWD receives water from the City and County of San Francisco's Regional Water System ("Regional System"), which is operated by the San Francisco Public Utilities Commission ("SFPUC"). This supply originates predominantly from the Sierra Nevada and is delivered through the Hetch-Hetchy aqueducts. The supply also includes treated water produced by the SFPUC from its local watersheds and facilities in Alameda and San Mateo Counties. Approximately 85% of the Regional System supply comes from the Tuolumne River and the Hetch-Hetchy Reservoir. The remaining 15% comes from local watersheds through the San Antonio, Calaveras, Crystal Springs, Pilarcitos and San Andreas Reservoirs.

The business relationship between San Francisco and its wholesale customers (including MPMWD) is largely defined by the Water Supply Agreement between the City and County of San Francisco and Wholesale Customers in Alameda County, San Mateo County and Santa Clara County ("Agreement") entered into in July 2009. The Agreement, which has a 25-year term, addresses water supply availability for the Regional System as well as the methodology used by the SFPUC in setting wholesale water rates. This agreement supersedes an earlier 25-year agreement signed in 1984.

The Agreement provides 184 million gallons per day ("MGD") to the wholesale customers during normal water years. This volume, referred to as the "Supply Assurance" is subject to reduction during periods of water shortage due to drought, emergencies, or other scenarios resulting in a water shortage. Each wholesale customer's share of the 184 MGD is referred to as their Individual Supply Guarantee ("ISG"). The MPMWD's ISG is 4.465 MGD (approximately 1,630 MG per year). Although the Agreement expires in 2034, the Supply Assurance and ISG continue in perpetuity.

The Agreement also recognizes the SFPUC's decision made in October 2008 to (a) defer any consideration of an increase to the 184 MGD Supply Assurance until 2018, (b) place an interim limit on sales of 184 MGD for all wholesale customers, including San Jose and Santa Clara, (i.e., those customers who do not have ISGs), (c) establish interim supply allocations ("ISAs") for each wholesale customer through 2018, and (d) develop an environmental enhancement surcharge to be applied to wholesale agencies that exceed their ISA, if total use by SFPUC's retail customers and wholesale customers exceeds 265 MGD.

However, these ISAs are entirely distinct from the permanent ISGs as they will last only until 2018 and will only be used as basis for applying the surcharge. Therefore, although the establishment of the ISAs may potentially increase the cost of water supplied by SFPUC to MPMWD if MPMWD exceeds its ISA at a time when collective deliveries from the Regional System exceed 265 MGD, the ISAs will not affect MPMWD's ISG of 4.465 MGD. Therefore, projected water supplies to MPMWD from SFPUC that are identified in the 2010 UWMP and rely on MPMWD's ISG have not been modified based upon the provisions of the new Agreement.

Currently MPMWD purchases 100% of its potable water supply from the SFPUC. The MPMWD's current and projected purchase quantities are approximately equal to an average of 2.79 MGD in 2014 (1,017 MG per year, Table 9) and 4.42 MGD based on projected demands in 2040 (1,614 MG per year), respectively. Both current and projected purchase quantities are less than MPMWD's ISG of 4.465 MGD.

7.1.2 Other Water Supplies

The MPMWD does not currently operate any potable groundwater wells for water supplies, but plans to construct approximately three to four emergency wells to provide water supply reliability to its northern service area, which includes the Bayfront Area. The wells will be designed to operate following a major earthquake or other emergency. The MPMWD is currently preparing environmental documents for the first well at the Corporation Yard and continues to review potential sites for the remaining wells.

The MPMWD is also assessing the feasibility of delivering recycled water to its southern service area in collaboration with the West Bay Sanitary District ("WBSD"). In November 2015, WBSD certified a *Mitigated Negative Declaration for the West Bay Sanitary District Recycled Water Project – Sharon Heights* (WBSD, 2015). The subject of this document is a proposed satellite wastewater treatment plant and recycled water treatment facility in the Sharon Heights area to serve irrigation demands to the Sharon Heights Golf and Country Club and potentially other customers in its vicinity. The MPMWD is also considering options related to service of recycled water to the entire Bayfront Area, or options related to onsite recycling and reuse. These and other options will be developed in more detail as part of the update to MPMWD's *Water System Master Plan*, that has an estimated completion date in 2017.

In addition, the City is considering the adoption of recycled water requirements as part of new projects meeting certain criteria and are within the Bayfront Area. As part of the proposed Project, several new zoning district categories are being added to the General Plan land use designations. Corresponding zoning district regulations for these zoning districts have been drafted and propose requirements regarding recycled water use such as provide dual plumbing, use recycled water for landscape irrigation, and / or evaluate alternative water sources, including on-site recycling, for toilet and cooling water uses.

7.2 TOTAL SUPPLY IN NORMAL, SINGLE DRY, AND MULTIPLE DRY YEARS

Water Code Section 10910

(c) (3) If the projected water demand associated with the proposed project was not accounted for in the most recently adopted urban water management plan, or the public water system has no urban water management plan, the water supply assessment for the project shall include a discussion with regard to whether the public water system's total projected water supplies available during normal, single dry, and multiple dry water years during a 20-year projection will meet the projected water demand associated with the proposed project, in addition to the public water system's existing and planned future uses, including agricultural and manufacturing uses.

As shown in Table 10, the MPMWD's current and planned future water supply for normal hydrologic years is assumed to be equal to its ISG of 4.465 MGD, or 1,630 MG per year. The anticipated dry-year supply estimates presented below are based on the delivery estimates provided by BAWSCA and SFPUC as part of the 2015 UWMP update process (SFPUC, 2016; BAWSCA, 2016) and per application of the Tier 1 and Tier 2 allocation processes described in the City's Water Supply Agreement[18] and the BAWSCA Drought Implementation Plan ("DRIP").

During single dry years, the MPMWD draft 2015 UWMP estimates that annual deliveries from SFPUC will be reduced to 1,281 MG (Menlo Park, 2015b). Supply shortfalls relative to total demands during single dry years are estimated to range between 4.5% in 2020 and 21% in 2040 (see Table 11).

During multiple dry years, the MPMWD draft 2015 UWMP estimates that annual deliveries from SFPUC will be reduced to 1,108 MG during a multi-year drought (Menlo Park, 2015b). Supply shortfalls relative to total demands during the second and third year of a drought are estimated to range between 17% in 2020 and 31% in 2040 (see Table 12).

Projected supply shortfalls will be met through the implementation of MPMWD's Water Shortage Contingency Plan. As described in the 2010 UWMP and the draft 2015 UWMP, MPMWD has developed a Water Shortage Contingency Plan that systematically identifies ways in which MPMWD can reduce water demands during dry years. The most recent update to the Water Shortage Contingency Plan was completed in May 2015. The overall reduction goals in the Water

---

[18] The Water Supply Agreement between the City and County of San Francisco and Wholesale Customers in Alameda County, San Mateo County and Santa Clara County entered into in July 2009.

Shortage Contingency Plan are established in five drought stages and for water demand reductions up to 50%.

As customers within the MPMWD service area, future development within the proposed Project would be obligated to comply with the demand reduction efforts imposed by MPMWD through implementation of the Water Shortage Contingency Plan. Therefore, the proposed Project would contribute a proportionate share of the reduction in water demands during dry years.

8 COMPARISON OF SUPPLY AND DEMAND

Water Code Section 10910

(c) (3) If the projected water demand associated with the proposed project was not accounted for in the most recently adopted urban water management plan, or the public water system has no urban water management plan, the water supply assessment for the project shall include a discussion with regard to whether the public water system's total projected water supplies available during normal, single dry, and multiple dry water years during a 20-year projection will meet the projected water demand associated with the proposed project, in addition to the public water system's existing and planned future uses, including agricultural and manufacturing uses.

As shown in Tables 8, 10, and 13, MPMWD is expected to have adequate water supplies during normal years to meet its total annual projected demands including the proposed Project demand (i.e., 343 MG per year) based on MPMWD's 2010 UWMP and draft 2015 UWMP.

During single-dry years, MPMWD's total annual water demand is expected exceed the total annual supply by approximately 50 MG, which results in a total water supply shortfall of 4.5%, either with or without the proposed Project demand (0 MG in 2020) based on MPMWD's draft 2015 UWMP. By 2040, MPMWD's total annual water demand, including the proposed Project demand, is estimated to exceed total single-dry year supply by approximately 333 MG, which results in a total water supply shortfall of 21% (Table 11). Without the proposed Project, there is sufficient supply to meet the anticipated demand during single dry years in 2040. Therefore, the proposed changes to the Bayfront Area creates an incremental shortfall of approximately 21% in 2040 compared to the without-Project conditions (Table 13).

During multiple-dry years in 2020, MPMWD's total annual water demand, either including or excluding the Project demand (0 MG in 2020), is projected to exceed the total annual supply by approximately 233 MG, which results in a total water supply shortfall of 17%. In 2040, MPMWD's total annual water demand, including the Project demand, is projected to exceed the total annual supply by approximately 506 MG, which results in a total water supply shortfall of 31% (Table 12). Without the proposed Project, the multiple dry year shortfall in 2040 is projected to be 13%. Therefore, the proposed Project creates an incremental shortfall of approximately 18% compared to the without-Project conditions (Table 13).

As described in Section 6, in response to anticipated future dry-year shortfalls, MPMWD has developed a Water Shortage Contingency Plan that systematically identifies ways in which MPMWD can reduce water demands and augment supplies during dry years. It is expected that, even without the proposed Project, the City would have to rely on implementation of its Water Shortage Contingency Plan during dry years to reduce demands. The MPMWD would likely have to implement higher stages of its Water Shortage Contingency Plan in response to a drought after the proposed Project is completed, however, it is not expected that MPMWD would have to change its operations or the general implementation of its Water Shortage Contingency Plan.

Further, this WSE Study has been prepared based on several very conservative assumptions. Firstly, it has been assumed that all of the proposed Project demands will be additive to the current demands in the Bayfront Area; in reality, the proposed Project will likely supplant some or all of the existing demands.

Secondly, as stated in Section 5.2.1, the water demand estimates for the proposed Project did not explicitly account for the increased water efficiency of toilets and other fixtures that are required for new construction per the CALGreen Code. Nor did they account for future zoning district regulations for the Bayfront Area that may reduce open space requirements on residential lots, and thus residential outdoor water use (Section 5.1.2).

Thirdly, as above, this WSE Study does not explicitly account for the fact that the City is considering the adoption of recycled water requirements within the Bayfront Area. To the extent that the City develops recycled water, or individual projects within the Bayfront Area implement on-site water recycling, the total future potable demands of the proposed Project would be expected to be less and therefore the resultant supply shortage will likely to be smaller. The MPMWD is developing these and other supplemental supply options as part of its 2017 *Water System Master Plan* update to minimize future dry year impacts.

9 CONCLUSIONS

As listed in Water Code §10910(c)(4), the primary purpose of this WSE Study is to evaluate whether sufficient water supply is available to meet all future water demands within the water supplier's service area, including those associated with the proposed Project, during normal and dry hydrologic years for a 20-year time horizon. This WSE Study has been prepared based on the following conservative assumptions:

- All of the proposed Project demands will be additive to the current demands in the Bayfront Area; in reality, the proposed Project will likely supplant some or all of the existing demands;
- The proposed Project demand estimates to do not account for future zoning district regulations for the Bayfront Area that may reduce the minimum requirement of open space on residential lots from what was analyzed, and thus reduce residential outdoor water use;
- The proposed Project demand estimates to do not directly account for the water savings associated with use of high-efficiency toilets (i.e., those that use 1.28 gallons per flush or less), or the increased efficiency of other water fixtures relative to the assumptions imbedded in the Pacific Institute Study; and
- The Project demand estimates to do not account for the potential conversion of the Project's landscape irrigation or other non-potable demands to recycled water, which may be required by the City's future zoning district regulations for the Bayfront Area.

Even with these conservative assumptions, based on the results of this WSE Study, MWMPD expects to have sufficient water supply to meet its planned demands, plus the demands of the proposed Project, during normal years through 2040.

During the 2040 worst-case drought scenario, MPMWD projects a water supply shortfall of 13% without the proposed Project, wherein it would implement its Water Shortage Contingency Plan. Using well-established methodologies for estimating water use and the conservative demand assumptions noted above, buildout of the proposed Project is estimated to increase this shortfall by approximately 18% in 2040, resulting in a total shortage of 31%.

Therefore, this study concludes that MPMWD has sufficient water supply to meet all future demands within its service area, including those associated with the proposed Project, during normal years for a 20-year time horizon. During dry years, MPMWD expects to experience some supply shortfalls over a 20-year time horizon and plans to meet these shortfalls through implementation of its Water Shortage Contingency Plan. Buildout of the proposed Project is conservatively estimated to increase the severity of these shortfalls by 18% in the 2040 worst-case drought scenario.

Based upon this increase in water supply shortfalls, MPMWD may have to implement higher stages of its Water Shortage Contingency Plan in response to a drought after the proposed Project is completed. However, it is not anticipated that MPMWD would need to change its operations or the general implementation of its Water Shortage Contingency Plan after Project buildout.

Further, to the extent that the City adopts recycled water requirements for the Bayfront Area and develops recycled water, or that individual projects within the Bayfront Area implement on-site water recycling, the total future potable demands of the proposed Project would be expected to be less and therefore the resultant supply shortage will likely to be smaller. The MPMWD is developing plans for recycled water and other supplemental supplies as part of its the 2017 *Water System Master Plan* update to minimize future dry year impacts.

Table 1
Historical Annual Water Use

ConnectMenlo - General Plan and M-2 Area Zoning Update
Menlo Park, California

Year	Total Annual Water Use within the Bayfront Area (MG) (a)
2010 (b)	224
2011	199
2012	162
2013	200
2014	191
Average Annual Water Use (2010 - 2014)	**195**

Abbreviations:

"MG" = million gallons

"MPMWD" = Menlo Park Municipal Water District

Notes:

(a) Total annual water use is based on MPMWD's metered water use data, provided by City staff on 15 and 24 September 2015 for 318 accounts within the Bayfront Area north of Highway 101.

(b) Actual water use in 2010 was only available from April through December and was interpolated to estimate water use for the whole year.

Table 2
Summary of Estimated Project Water Demand at Buildout (2040)
ConnectMenlo - General Plan and M-2 Area Zoning Update
Menlo Park, California

Abbreviations:

"CII" = Commercial, Industrial, and Institutional
"MG" = million gallons
"GPCD" = gallons per capita per day

Notes:

(a) The estimated annual indoor water demand at buildout for each project component is calculated in Tables 3a through 3c.
(b) The estimated annual outdoor water demand at buildout for each project component is calculated in Table 4.
(c) The estimated total annual water demand for residential and non-residential land uses, in MG, is calculated as the sum of indoor and outdoor water demands. Totals may not sum exactly due to rounding.
(d) The estimated total water demand, in GPCD, is calculated for residential land uses and the Project total. It is calculated as the sum of indoor and outdoor water demands divided by the estimated population for the project (see Table 3a) and the days per year. Total water demand in GPCD is not calculated for non-residential land uses.

"GPCD" = gallons per capita per day
"gphd" = gallons per household per day
"MG" = million gallons

Table 3a
Estimated Project Annual Indoor Water Demand, Residential Land Use
ConnectMenlo - General Plan and M-2 Area Zoning Update
Menlo Park, California

Notes:

(a) Number of residential dwelling units and population are based on project information included in Reference 1.

(b) Residential indoor water use factor was estimated using a model of total indoor water use developed in Reference 2. The statistical model is based on single family homes that meet the standards for the Federal Energy Policy Act of 1992. The following assumptions were used for estimating project residential water uses:

1. The average household size (i.e., number of residents per home) is 2.57 persons/dwelling unit.
2. Home water softening systems (e.g., regenerating ion exchange units or reverse osmosis units) are not installed.
3. High-efficiency clothes washers that use less than 30 gallons of water per load are installed in 75% of the dwelling units
4. Significant leaks (i.e., leaks greater than 50 gallons per day) occur at approximately 9% of the dwelling units.

Based on the above assumptions, the residential indoor water use factor is estimated to be 127 gphd, or 49.4 GPCD.

(c) The average daily indoor water use is estimated by multiplying the number of dwelling units and the household water use factor.

(d) Total annual indoor water demand for residential land uses, in MG, is calculated as the product of daily indoor water use and the days per year. The product is then divided by the number of gallons per MG (1,000,000).

Abbreviations:

"CII" = Commercial, Industrial, and Institutional
"MG" = million gallons
"emp" = employees
"gpd" = gallons per day
"R&D" = Research and Development
"sq ft" = square feet

Table 3b
Estimated Project Annual Indoor Water Demand, CII Land Use (Excluding Transit Center)

ConnectMenlo - General Plan and M-2 Area Zoning Update
Menlo Park, California

Notes:

(a) Areas of proposed land uses are based on project information included in Reference 1.
(b) Employee densities of office and hotel land uses were provided by City staff on 20 November 2015. Employee densities of life science and commercial/retail land uses are based on Table B1 of Reference 2.
(c) The number of employees was estimated by multiplying the floor area ratio, expressed in 1,000 square feet, by the employees per 1,000 square feet.
(d) The employee indoor water use factors are based on information contained in Appendices E and F of Reference 3, which are each based on a 225-day work year.
(e) The employee water use factors reported in Reference 3 represent water use in older buildings; they do not incorporate the benefits of more recent water saving technologies or account for the CALGreen standards. Therefore, to account for reductions in water use associated with the installation of water-efficient plumbing fixtures, appliances, and other recent technologies, conservation savings, based on the "best" conservation savings potential presented in Appendices E and F of Reference 3, were calculated in Appendix A and applied to each land use.
(f) Daily employee water use after conservation is calculated by multiplying the employee indoor water use factor by 100% minus the conservation potential.
(g) The total daily indoor water use for each land use is estimated by multiplying the number of employees by the land use-specific employee daily water use.
(h) Total annual indoor water use is calculated by multiplying the daily indoor water use by the 225-day work year from Reference 3 for the employee water use factors, then dividing by 1,000,000 gallons per MG.

"gpm" = gallons per minute

Table 3c
Estimated Project Annual Indoor Water Demand, Transit Center
ConnectMenlo - General Plan and M-2 Area Zoning Update
Menlo Park, California

Notes:

(a) Indoor water use in the transit center is assumed to be associated with restroom visits of transit center users.
(b) Daily usage of the transit center is based on project information included in Reference 1.
(c) The average number of restroom visits assumes one restroom visit occurs in every ten person-usages of the transit center.
(d) Fixture rates are based on requirements of the CalGreen standards in Reference 2.
(e) The average number of fixture uses per restroom visit are estimated based upon the following assumptions:
1. Usage of the transit center restroom is from 50% male and 50% female;
2. On average each restroom visit consists of one toilet use and one 30-second lavatory use; and
3. On average males use the urinal in four out of five toilet uses.
(f) The daily indoor water use for each fixture is estimated by multiplying the fixture rate by the number of restroom visits per day and the number of fixture uses per visit.
(g) Total annual indoor water demand, in MG, is calculated as the product of daily indoor water use and the days per year. The product is then divided by the number of gallons per MG (1,000,000).

Table 4
Estimated Project Annual Outdoor Water Demand
ConnectMenlo - General Plan and M-2 Area Zoning Update
Menlo Park, California

	[A]	[B]	[C]	[D] D = B / 12 x C x A * 0.326
Land Use	**Total Landscaped Area** (acres) (a)	**Reference ET (ETo)** (inches/year) (b)	**ET Adjustment Factor** (c)	**Total Annual Outdoor Water Demand** (MG) (d)
Residential	15.3	42.8	0.55	10 (e)
Non-residential	46.2	42.8	0.45	24
			Total Project Outdoor Water Demand	**34**

Abbreviations:

"ET" = evapotranspiration
"MG" = million gallons
"GPCD" = gallons per capita per day
"CII" = commercial, industrial, and institutional
"MAWA" = Maximum Applied Water Allowance
"MWELO" = Model Water Efficient Landscape Ordinance

Table 4
Estimated Project Annual Outdoor Water Demand
ConnectMenlo - General Plan and M-2 Area Zoning Update
Menlo Park, California

Notes:

(a) Areas dedicated to landscaping are based on project information included in Reference 1. Non-residential land use includes CII spaces, transit center, and public spaces.

(b) The reference ET is based on values for Redwood City in Appendix A of Reference 2. Redwood City is the closest available City to the project area.

(c) Per the California MWELO (Reference 2), ET adjustment factors of 0.55 and 0.45 were used to calculate the MAWA for residential and nonresidential areas, respectively. The project does not include any Special Landscape Areas, which include recreation areas, areas permanently and solely dedicated to edible plants, and areas irrigated with recycled water.

(d) Total annual landscaping water demand, in MG, is calculated based on the MAWA formula in Reference 2. Total annual landscaping water demand is conservatively assumed to be equal to the MAWA, which is the upper limit of annual applied water for the established landscaped area based upon the area's reference evapotranspiration, the ET Adjustment Factor, and the size of the landscape area.

(e) The residential outdoor water demand of 10 MG is equivalent to 2.3 GPCD based on the proposed number of residential units and population (see Table 3a).

Table 5
Historical Water Use for MPMWD
ConnectMenlo - General Plan and M-2 Area Zoning Update
Menlo Park, California

Abbreviations:

"MG" = million gallons
"MPMWD" = Menlo Park Municipal Water District
"UWMP" = Urban Water Management Plan

Notes:

(a) The measured annual water use for years 2005 through 2010 was from MPMWD's 2010 UWMP (Reference 1). The measured annual water use for years 2011 through 2014 was obtained from City staff on 30 September 2015. Totals may not sum exactly due to rounding.

(b) Irrigation water use includes water use for irrigation meters of accounts that are sub-metered. For most accounts, indoor and outdoors water use are measured by one meter and are shown in other categories. Therefore, irrigation water use shown here does not represent all of the outdoor irrigation water use within MPMWD.

(c) Other water use includes water used for temporary meters.

(d) "Non-revenue water" is defined herein as the difference between the MPMWD's customers' metered use and the MPMWD's metered supply. The total water use shown here does not include non-revenue water.

Table 6
Projected Future Water Demands of Current General Plan Buildout for MPMWD
ConnectMenlo - General Plan and M-2 Area Zoning Update
Menlo Park, California

Abbreviations:

"MPMWD" = Menlo Park Municipal Water District
"UWMP" = Urban Water Management Plan
"MG" = million gallons

Notes:

(a) The projected future water demands of current General Plan buildout are from the MPMWD's draft 2015 UWMP (Reference 1).
(b) Irrigation water use includes water use for irrigation meters of accounts that are sub-metered and does not represent all of the outdoor irrigation water use within MPMWD.
(c) Other water use includes water used for temporary meters.
(d) "Non-revenue water" is defined herein as the difference between the MPMWD's customers' metered use and the MPMWD's metered supply. Thus, non-revenue water includes apparent losses such as customer metering inaccuracies, real losses such as distribution main leakage, and authorized unmetered uses such as fire hydrant flow testing. The values for non-revenue water were from MPMWD's draft 2015 UWMP and are assumed to be approximately 4.5% of the total water use.
(e) The total water demand is the sum of total water use and non-revenue water. The projected water demands include savings from plumbing code updates and conservation efforts the City plans to undertake.

Menlo Park, California

Project Name (a)	Type of Use	Size	Status	Project Location	Included in General Plan Water Demand Projections?	Estimated Annual Water Demand (MG)
Sequoia Belle Haven	Residential	90 du	Approved	North of U.S. 101	Yes	--
Facebook Building 23	Office	180,108 sq ft	Approved	North of U.S. 101	Yes	--
German American School	School	400 students	Approved	South of U.S. 101	Yes	--
Water Demands for Planned Projects not Included in Current General Plan Buildout Demand Projections (MG)						**31**

Abbreviations:
"Cal Water" - California Water Service Company
"du" = dwelling units
"MG" million gallons
"MPMWD" = Menlo Park Municipal Water District
"R&D" = Research and Development
"sq ft" = square feet

Notes:
(a) Projects were identified by City staff based on applications received before or near June 18, 2015 Notice of Preparations. Table includes all projects within MPMWD's service area (and not those within Cal Water's service area) that have filed a complete development application for five (5) or more net new residential units or 5,000 sq ft or more of net new commercial space.
(b) Water demand for the Facebook Expansion Project was estimated in Reference 1.
(c) Water demand for the New Magnate High School was provided by City staff on 21 December 2015. The annual water demand was estimated using 7.9 gallons per day per student for 400 students and 180 school days per year.
(d) Facebook West (Building 20) was completed early 2015 but is included in the approved project list because 2015 City water meter data are not yet available.

Total Projected Future Water Demands for MPMWD
ConnectMenlo - General Plan and M-2 Area Zoning Update
Menlo Park, California

Water Demand Estimate	Projected Future Water Demand (MG)				
	2020	**2025**	**2030**	**2035**	**2040**
Water Demand of Current General Plan Buildout (a)	*1,310*	*1,286*	*1,265*	*1,251*	*1,240*
Water Demand for Other Planned Projects (b)	*31*	*31*	*31*	*31*	*31*
Total Water Demand without Project	**1,341**	**1,317**	**1,296**	**1,282**	**1,271**
Project Water Demand (c)	0	86	172	257	343
Total Water Demand with Project	**1,341**	**1,403**	**1,468**	**1,539**	**1,614**

Abbreviations:

"MG" = million gallons
"MPMWD" = Menlo Park Municipal Water District
"UWMP" = Urban Water Management Plan

Notes:

(a) The total projected MPMWD-wide water demand between 2010 and 2040 is based on water demand projections within the MPMWD's draft 2015 UWMP (Reference 1) (see Table 6).
(b) The total estimated water demand for currently planned projects is 31 MG (see Table 7).
(c) The proposed project is expecting buildout by 2040 over a 25-year horizon, based on information provided by City staff on 3 November 2015. Therefore, project water demands at buildout (Table 2) are phased from 2020 to 2040 to reflect phased buildout.

Recycled Water	0	0	0	0	0
Total Normal Year Water Supply (b)	1,630	1,630	1,630	1,630	1,630

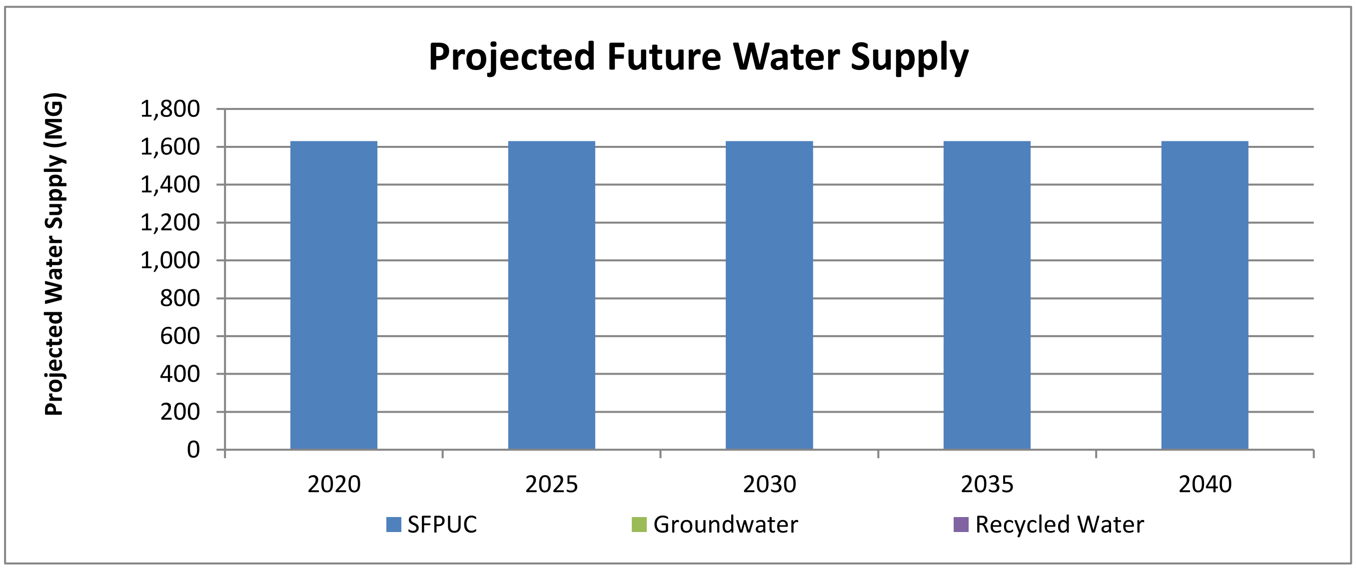

Table 10
Projected Future Normal Year Water Supply for MPMWD
ConnectMenlo - General Plan and M-2 Area Zoning Update
Menlo Park, California

Abbreviations:

"ISA" = Interim Supply Allocation
"MG" = million gallons
"MGD" = million gallons per day
"MPMWD" = Menlo Park Municipal Water District
"SFPUC" = San Francisco Public Utilities Commission

Notes:

(a) The MPMWD has a SFPUC individual supply guarantee of 4.465 MGD, or approximately 1,630 MG per year. The MPMWD's ISA through 2018 is 4.4 MGD, or approximately 1,607 MG per year, but this ISA is only triggered when the demand of the Regional System as a whole exceeds 265 MGD, and then it only means that MPMWD would be charged a surcharge for any incremental use over the ISA amount (Reference 1).
(b) Total supply is the sum of the potable and recycled water supplies.

Table 13
Incremental Impact of the Project on MPMWD's Water Supply and Demand in Normal and Dry Years
ConnectMenlo - General Plan and M-2 Area Zoning Update
Menlo Park, California

Abbreviations:

"MG" = million gallons
"MDY" = Multiple Dry Year
"MPMWD" = Menlo Park Municipal Water District
"SDY" = Single Dry Year
"UWMP" = Urban Water Management Plan

Notes:

(a) Projected available water supplies during normal, single dry and multiple dry years are from MPMWD's draft 2015 UWMP (Reference 1), and are documented in Tables 10, 11, and 12.
(b) Values for projected water demand with and without project are calculated in Table 8.
(c) Values are subject to rounding.

References:

1. 2015 Urban Water Management Plan, prepared by the City of Menlo Park, in development.

Appendix A

Summary of Conservation Saving Factors for Indoor Water Uses

and

Appendices E and F to the Pacific Institute's *Waste Not, Want Not: The Potential for Urban Water Conservation in California*, November 2003.

Savings potential for each end use in specific CII land uses are listed in Appendices E and F of the Pacific Institute Study. Using data from the Pacific Institute Study, the conservation factor for indoor water use is calculated in Tables A-1 through A-4 below.

Table A-1: Indoor Conservation Factor for Office Buildings

End Use	**Water Use (TAF)** (a) (b)	**Conservation Potential** (c)		
		Best	**Low**	**High**
Restroom	88	49%	49%	49%
Cooling	77.9	26%	9%	41%
Kitchen	10.2	20%	20%	20%
Other	33.9	10%	0%	25%
Indoor Total (d)	**210**	**<u>33%</u>**	**25%**	**41%**

Notes and Abbreviations:

(a) TAF = Thousand Acre-Feet
(b) Total water use in sampled office buildings obtained from Table E-1 of the Pacific Institute Study.
(c) Conservation potential for each end use in office buildings are obtained from Table E-3 of the Pacific Institute Study.
(d) The indoor total conservation potential is calculated as the weighted average of the conservation potential for each end use based on their water use.

Table A-2: Indoor Conservation Factor for Life Science Buildings

End Use	**Water Use (TAF)** (a) (b)	**Conservation Potential** (c)		
		Best	**Low**	**High**
Process	52.5	43%	29%	53%
Cooling	15.0	26%	9%	41%
Restroom	3.8	49%	49%	49%
Indoor Total (d)	**71.3**	**<u>40%</u>**	**26%**	**50%**

Notes and Abbreviations:

(a) TAF = Thousand Acre-Feet
(b) Total water use in sampled high tech industry obtained from Table F-33 of the Pacific Institute Study.
(c) Conservation potential for each end use in the high tech industry are obtained from Table F-33 of the Pacific Institute Study.
(d) The indoor total conservation potential is calculated as the weighted average of the conservation potential for each end use based on their water use.

Table A-3: Indoor Conservation Factor for the Commercial / Retail Industry (a)

End Use	**Grocery Stores**		**Other Retail**	
	Water Use (TAF) (b) (c)	**"Best" Conservation Potential** (d)	**Water Use (TAF)** (b) (c)	**"Best" Conservation Potential** (d)
Restroom	5.9	51%	30.7	N/A
Cooling	16.9	26%	24.8	N/A
Other	7.6	10%	13.0	N/A
Kitchen	3.1	20%	4.7	N/A
Indoor Total (e)	33.5	26%	83.2	37%
Indoor Total for the Commercial / Retail Industry (f)				**34%**

Notes and Abbreviations:

(a) Conservation factors were determined separately for grocery stores and other retail stores in the Pacific Institute Study. These factors were combined to obtain the indoor total conservation factor for the commercial / retail industry.

(b) TAF = Thousand Acre-Feet

(c) Total water use in sampled grocery and retails stores obtained respectively from Tables E-23 and E-24 of the Pacific Institute Study.

(d) Conservation potential for each end use in grocery stores are obtained from Table E-23 of the Pacific Institute Study. Conservation potential for each end use in other retail stores are likely to have printed erroneously in Table E-24, therefore, the indoor conservation potential is assumed to be the total conservation potential.

(e) The indoor conservation potential for grocery stores is calculated as the weighted average of the conservation potential for each end use in grocery stores based on their water use.

(f) The indoor total conservation factor is calculated as a weighted average of conservation potential in grocery stores and other retail stores based on their water use.

Table A-4: Indoor Conservation Factor for Hotels

End Use	**Water Use (TAF) (a) (b)**	**Conservation Potential**		
		Best	**Low**	**High**
Restroom	16.7	31%	31%	31%
Laundry	4.2	54%	42%	66%
Cooling	3	26%	9%	41%
Kitchen	2.4	20%	20%	20%
Other	0.9	0%	0%	0%
Indoor Total	**27.2**	**32%**	**28%**	**36%**

Notes and Abbreviations:

(g) TAF = Thousand Acre-Feet

(h) Total water use in sampled hotels obtained from Table E-4 of the Pacific Institute Study.

(i) Conservation potentials for each end use in hotels are obtained from Table E-6 of the Pacific Institute Study.

The indoor total conservation potential is each calculated as the weighted average of the conservation potential based on total water use for “best”, “high”, or “low” potential.

Appendix E

Details of Commercial Water Use and Potential Savings, by Sector

Office Buildings
(SIC codes 60–64, 67, 73, 81, 87, and 90)

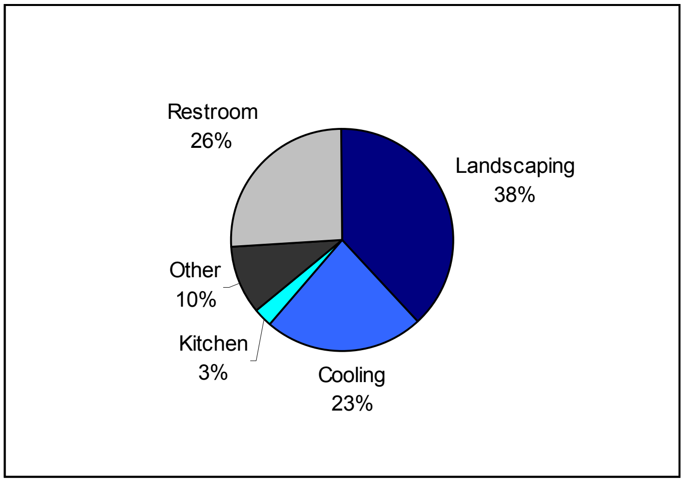
Offices buildings house a wide variety of companies ranging from insurance brokers to law offices. Although the types of offices differ, their employees are usually engaged in similar activities and can therefore be aggregated under one category. We did not, however, include SIC code 65 (real estate) or SIC code 86 (membership organizations) in our analysis, because the GEDs estimated were unreasonably high; indicating problems with either the data or the categorization. For example, we suspect that SIC code 65 includes multi-family housing in addition to real estate offices because it includes in its description "apartment building operators," and rental offices are often located within apartment complexes, where water is used for residential purposes.

Table E-1
Employment and Water Use in Office Buildings (2000)

Sub-industry	SIC code	Gallons per Employee Day (GED)[1,2]	Employees	Annual Use, Thousand Acre-Feet (TAF)
Depository	60	58	198,500	7.9
Non-Depository	61	135	84,700	7.9
Security, Broker	62	176	75,100	9.1
Insurance	63	169	136,300	15.9
Insurance	64	129	83,400	7.4
Holding/Investment	67	176	39,680	4.8
Business	73	129	1,350,530	120.1
Legal	81	99	123,204	8.4
Engineering	87	113	472,069	36.7
Government	90	136	1,279,745	120.3
Office Buildings Total		**127 (average)**	**3,843,303**	**338.5**

[1] Based on a 225-day year.
[1] Note that the GED coefficients estimated for 1995 were decreased by 20% to obtain the GED coefficients for 2000 for the commercial sector. See the write-up on correcting GED Estimates for 2000 in the report.

Figure E-1
Water Use, by End Use, in Office Buildings



Source: Calculated from MWD audit data of selected office buildings (MWD 2002).

Comparison of GED-derived Estimate to Modeled Water Use

We modeled water use in office buildings, using published estimates of restroom visits by employees, irrigated turf area, cooling requirements etc. We compared our GED-derived estimate of water use per employee to that predicted by the model Table E-2. The end-use calculations in the GED-derived estimate are from Figure E-1 and the model's assumptions are derived from the end use data in Appendix D.

Table E-2
Modeled Water Use in Office Buildings (2000)

End Use	Unit	Rate	Number	Modeled Water Use (GED)	GED-derived (GED)
Toilets[1]					
Employee use	gpf	3.00	2.60 flushes/day	7.8	
Visitor use	gpf	3.00	0.33 flushes/day	1.0	
Urinals[1]					
Employee use	gpf	1.60	1.25 flushes/day	2.0	
Visitor use	gpf	1.60	0.17 flushes/day	0.3	
Faucets[1]					
Employee use	gpf	0.11	3.85 flushes/day	0.4	
Visitor use	gpf	0.11	0.50 flushes/day	0.1	
Total restroom				11.6	33.0
Cooling	gal/sq ft/day	0.07[2]	350[3] sq.ft/employee	23.3	29.2
Landscaping	gal/sq ft	0.08[4]	547[5] sq. ft/employee	20.7	48.3
Kitchen	gal/meal	10.1[6]	0.33 meals/employee/day	3.3	3.8
Other				12.7	12.7
Total				**72**	**127**

[1] See Appendix D.

[2] Two case studies estimated 15 and 34 gal/sq ft./year. The average is about 25 gal/sq.ft/year. We estimate that only 60 percent of office buildings have cooling towers so this works out to 15 gal/sq ft/year on average or 0.07 gal/sq ft/day (Dziegielewski et al. 2000).
[3] Statistical average of 67 office buildings (Dziegielewski et al. 2000).
[4] See Appendix D.
[5] MWD 2002.
[6] See Appendix D.

Estimate of Potential Savings

By applying the conservation potential calculated in the end use studies (see Appendix D) to our GED-derived estimates of end use, we estimated potential water savings (shown in Table E-3).

Table E-3
Potential Water Savings in Office Buildings (2000)

End Use	Water Use (TAF)	Conservation Potential (percent)			Conservation Potential (TAF)		
		Low	High	Best	Low	High	Best
Landscaping	128.6	38%	53%	50%	48.3	68.0	64.2
Restroom	88.0	49%	49%	49%	43.4	43.4	43.4
Cooling	77.9	9%	41%	26%	7.4	32.3	20.0
Kitchen	10.2	20%	20%	20%	2.0	2.0	2.0
Other	33.9	0%	25%	10%	0.0	8.5	3.4
Total	**338.5**	**30%**	**46%**	**39%**	**101.1**	**154.1**	**133.0**

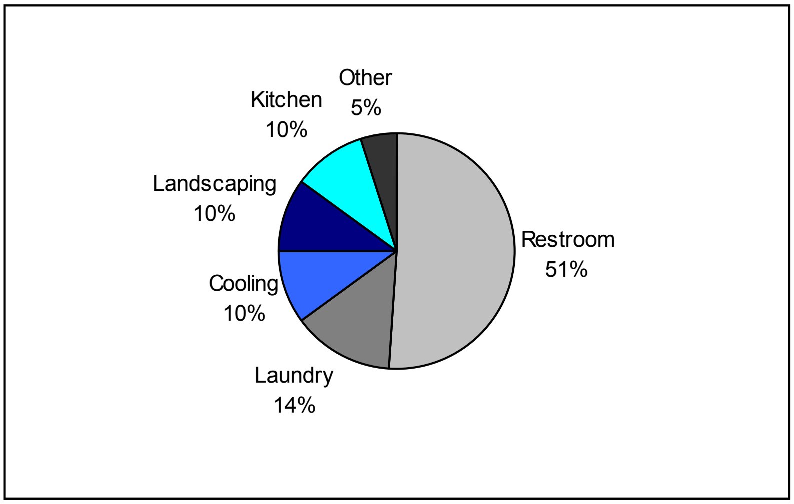
Hotels (SIC codes 701 and 704)

Sub-industries under SIC code 70 include hotels, motels, rooming and boarding houses, recreational vehicle parks, camp sites, and a variety of other types of lodging establishments. Because the literature focuses primarily on water use in hotels, motels, and bed and breakfasts (SIC codes 701 and 704), we limited our focus to these three types of lodging establishments, which we refer to collectively as hotels.

Table E-4
Employment and Water Use in the Hotel Industry (2000)

Industry	SIC codes	GED	Employees	Annual Use (TAF)
Hotels	701,704	240	182,640	30.3

Figure E-2
Water Use, by End Use, in the Hotel Industry



Source: Calculated from MWD audit data of 93 hotels (MWD 2002).

Comparison of GED-derived Estimate to Modeled Water Use

We modeled the water use in hotels, using published estimates of restroom visits, showers, faucet use by guests and employees, irrigated turf area, cooling requirements etc. We converted our GED-derived estimate of water use per employee into water use per occupied room per day and then compared it to that predicted by the water use model. The end use calculations in the GED-derived estimate are from Figure E-2 and the model's assumptions are based on the end use data in Appendix D and a study of water use in the hotel industry (Redlin and deRoos 1990).

Table E-5
Modeled Water Use in Hotels (2000)

		Typical Use/Occupied Room/Day			
	Measurement Unit	**Rate/Unit**	**Number of Units**	**Water Use (gal/day)**	**GED-derived Use (gal/day)**
Showers[1]	gal/minute	2.2	16.0	35.2	
Faucets[1]	gal/minute	1.3	0.4	0.6	
Toilets[1]	gal/flush	3.0	4.0	12.0	
Laundry[2]	gal/lb.	2.5	8.0[3]	20.0	
Kitchen	gal/meal	7.6[4]	2.2[5]	17.0	
Icemakers	gal/meal	0.5[6]	2.2[5]	1.1	
Misc.	gal			25.0	

INDOOR				**111.0**	
Cooling[7]	gal/CDD	5.6	1.4	8.0	
COOLING				**8.0**	
Irrigation[8]	gal/sq. ft.	0.2	50.0	10.0	
Pool				0.5	
OUTDOOR				**10.5**	
TOTAL				**130**	**117**[9]

[1] See Appendix D.
[2] See Appendix D.
[3] Pounds/occupied room/day of laundry is obtained from the average of the 12 hotels in Redlin and de Roos (1990). Eighty-nine percent of hotels have in-house laundries (Redlin and de Roos 1990).
[4] Average gal/meal is obtained from the restaurant sector. Seventy-six percent of hotels have restaurants (Redlin and de Roos 1990).
[5] Meals/occupied room (Redlin and de Roos 1990)
[6] 0.5 lbs/meal * 1 gal/lb : lbs/meal taken from 1994 ASHRAE Refrigeration Handbook, 1 gal/lb estimated from Pike 1995.
[7] Nearly 50 percent of the hotels surveyed in Redlin and de Roos (1990) had central cooling. Average annual Cooling Degree Days (CDD) in California was 1035. Therefore Cooling Degrees per day = 1035*50%/365 = 1.4 gal/CDD obtained from Redlin and de Roos (1990).
[8] See Appendix D.
[9] We used information on the total number of occupied hotel rooms and total water used by the hotel sector in 2000. When we divided 2000 water use (30.3 TAF) by 350,000 rooms times the average occupancy rate for the year (66%), the water use/occupied room/day was about 117 gallons.

Estimate of Potential Savings

By applying the conservation potential calculated in the end use studies (see Appendix D) to our GED-derived estimates of water use, we estimated potential water savings (shown in Table E-6).

Table E-6
Potential Water Savings in the Hotel Industry (2000)

End Use	**Water Use (TAF)**	**Conservation Potential (percent)**			**Conservation Potential (TAF)**		
		Low	**High**	**Best**	**Low**	**High**	**Best**
Restrooms	16.7	31%	31%	31%	5.3	5.3	5.3
Laundry	4.2	42%	66%	54%	1.8	2.8	2.3
Cooling	3.0	9%	41%	26%	0.3	1.3	0.8
Landscaping	3.0	47%	53%	50%	1.1	1.6	1.5
Kitchen	2.4	20%	20%	20%	0.5	0.5	0.5
Other	0.9	0%	0%	0%	0.0	0.0	0.0
Total Savings	**30.3**	**30%**	**38%**	**34%**	**9.0**	**11.4**	**10.3**

Golf Courses (SIC code 7992)

SIC code 79 includes various recreational establishments such as theaters, amusement parks, movie studios, and golf courses. Because water use in these industries varies tremendously, we included only golf courses (SIC code 7992), which comprise a very water intensive sub-industry, in our analysis. Indeed, in 2000, there were nearly 900 golf courses in the state, covering close to 89,000 acres (Horton, 2002), and using 342 TAF of water annually.

Table E-7
Employment and Water Use at Golf Courses (2000)

Industry	SIC	GED	Employees	Annual Use (TAF)
Golf Courses	7992	7,718	34,100	341.8[1]

[1] Freshwater comprised 229 AF of 2000 use and the remaining water was reclaimed water (California State Water Resources Control Board 2002).

Although we do not know the exact breakdown of water use at golf courses, we do know that water is used primarily for landscaping. Without published data, we assumed that 95 percent of golf course water use is used for irrigating turf while the remaining 5 percent is used in restrooms, kitchens, and cooling, which we consolidated as "other." Golf courses tend to use high amounts of reclaimed water in addition to self-supplied and agency-supplied water.[1]

Comparison of GED-derived Estimate to Modeled Water Use

Since landscaping comprises nearly all of a golf course's water use and little or no information was available on restroom, kitchen, or cooling uses, we modeled only the irrigation component to crosscheck our GED-derived estimate. First, we totaled the number and acreage of golf courses by hydrological region and then applied what we know about turf water use in different regions to these acreages to determine total water use in 2000.[2]

[1] According to the National Golf Foundation, in 1998, about 33% of the water supply to golf courses in Region 8 (which includes So Cal, W.AZ and So NV) was supplied from reclaimed water. This percentage was assumed to apply to California. The rest of the water supply to golf courses was from freshwater sources: lakes and streams (22%), wells (32%), public supply(9%), and other (5%). (Thompson, 2002).

Table E-8
Modeled Irrigation Water Use at Golf Courses

Hydrologic Region	Percentage Golf Acreage[1]	Acreage 2000[2]	EV Ratio w.r.t Central Coast[3]	Annual Water Use (AF/Acre)	Modeled Total Irrig. Use (TAF)	GED-derived Estimate of Total Use (TAF)
North Coast	3%	2,945	1.01	2.02	**5.9**	
San Francisco	15%	13,394	1.26	2.52	**33.8**	
Central Coast	7%	6,126	1.00	2.00	**12.3**	
South Coast	46%	41,012	1.37	2.74	**112.4**	
Tulare Lake	5%	4,082	1.80	3.60	**14.7**	
San Joaquin	6%	5,687	1.80	3.60	**20.5**	
Sacramento River	13%	11,211	1.80	3.60	**40.4**	
North Lahontan	1%	544	1.56	3.12	**1.7**	
South Lahontan	4%	3,412	2.08	4.16	**14.2**	
Colorado River	0%	360	2.53	5.06	**1.8**	
Total Irrigation		**88,773**			**258**	**324.6**
Total All End Uses						**341.8**

[1] The number of golf courses was reported by county and we translated this into hydrologic region (California Golf Owners Association 2002). We then converted the number of golf courses in each region into a percentage of the state's total golf course acreage.
[2] The total acreage of golf courses was reported by the California Golf Owners Association (2002) and then distributed among regions based on the percentage of golf courses in each region.
[3] see Appendix D.

Estimate of Potential Savings

By applying the conservation potential calculated in the end use studies (see Appendix D) to our GED-derived estimates of water use, we estimated potential water savings (shown in Table E-9).

Table E-9
Potential Water Savings at Golf Courses (2000)

End Use	Water Use (TAF)	Conservation Potential (percent)			Conservation Potential (TAF)		
		Low	**High**	**Best**	**Low**	**High**	**Best**
Irrigation (Freshwater)	211.9[1]	26%	100%	39%	60.1	211.9[2]	88.7
Irrigation (Reclaimed)	112.8[1]	0%	0%	0%	0	0	0
Other	17.1	0%	0%	0%	0	0	0
Total	**341.8**	**26%**	**100%**	**39%**	**55.6**	**82.1xx**	**211.9xx**

[1] According to the National Golf Foundation, in 1998, about 33% of the water supply to golf courses in Region 8 (which includes So Cal, W.AZ and So NV) was supplied from reclaimed water. (Thompson, 2002)
[2] The low and best estimates coincide with the findings in Appendix D while the high estimate includes potential freshwater savings if all freshwater currently used in golf course irrigation (229 AF/year) was replaced with reclaimed water.

Hospitals (SIC code 806)

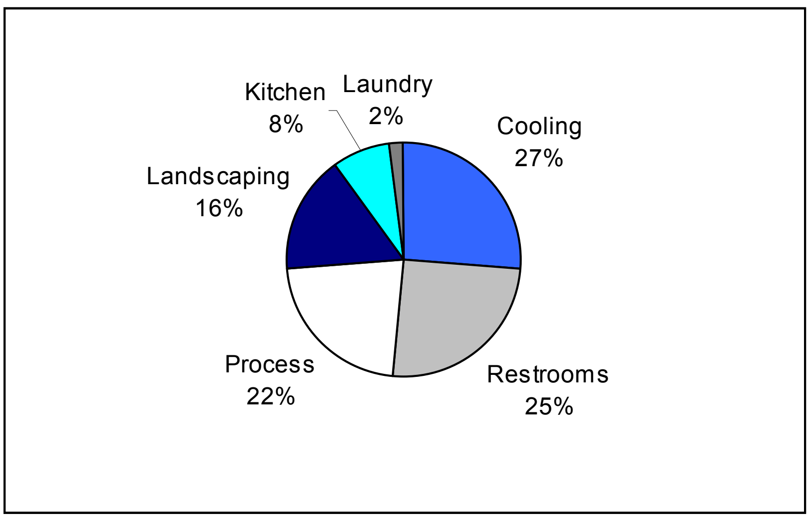
Hospitals are classified under SIC code 80, which also includes physicians' offices (SIC codes 801, 802, and 804), nursing homes and special care facilities (SIC code 805), laboratories and dental clinics (SIC code 807), and outpatient clinics and blood banks (SIC codes 808 and 809). Because the water use in these facilities varies considerably, we focused solely on hospitals (SIC code 806), which are the largest single sub-industry in SIC code 80. Table E-10 and Figure E-3 show water use in hospitals by end-use.

Table E-10
Employment and Water Use in the Hospital Industry (2000)

Industry	SIC code	GED[1,2]	Employees	Annual Use (TAF)
Hospitals	806	124	428,450	36.7

[1] Based on a 225-day year.
[2] Note that the GED coefficients estimated for 1995, were decreased by 20% to obtain the GED coefficients for 2000 for the commercial sector.

Figure E-3
Water Use, by End Use, in the Hospitals



Source: Calculated from MWD audit data of regional hospitals (MWD 2002).

Process Water Description

Hospitals use process water to operate the following equipment:

- X-ray machines (as part of the film development process);
- Steam sterilizers (for sterilizing equipment);
- Washers;
- Autoclaves (for sterilizing equipment);
- Laboratories;
- Boilers;
- Vacuum pumps (for sterilizing environments); and

- Other, misc. processes.

Potential Process Water Savings

Table E-11
Potential Process Water Savings in the Hospital Industry (2000)

Sub-end Use	Water Conservation Measure	Sub-end Use (x) [1]	Technology Savings (c)	Penetration Rate (p)	Conservation Potential (s) [2]
		(percent)			
X-ray	Recirculating x-ray machines[3]	22%	90%[3]	5%[4]	90%
Steam sterilizers	Replace steam sterilizers with ozone based ones; recirculate water where replacement is not possible	23%	70%[5]	50%[6]	65%
Washers	None				
Autoclave	None				
Laboratories	Improve efficiency of reverse osmosis units; install ultrasonically controlled sinks; retrofit sterilizers	1%	20%	30%[6]	20%
Boilers	Recycle boiler condensate	1%	50%	85%[6]	50%
Vacuum pumps	Replace with oil-ring pumps	4%	100%[7]	95%[8]	100%
Other			0%	50%	30%
Total			**52%**		

[1] Estimated from data in three case studies (B&V 1991 (c&d), MWD 1996, B&M, 1995).
[2] Percent Savings Potential = Savings * (1-Penetration)/ (1- Savings*Penetration Rate)
[3] Water Saver/Plus TM units can save 98 percent of water used for x-ray machines (CUWCC 2001). Because this technology is relatively new, only a handful of machines have been retrofitted and we assumed that 95 percent of x-ray machines in California are yet to be replaced.
[4] Estimated from data in CUWCC (2001).
[5] The typical conservation recommendations for sterilizers include installing auto-shutoff valves, running the sterilizer or autoclave with full loads only, and recycling steam condensate and non-contact cooling water from sterilizers as make-up water in cooling towers or boilers. These conservation measures could result in savings up to 60 percent (LADWP 1991). However, more recently a few hospitals have replaced steam sterilization with chemical-based sterilizers, saving both water and energy. Almost 70 percent of a hospital's sterilizing needs can be met without steam (Scaramelli and Cohen 2002).
[6] Estimate based on how many years the technology has been around
[7] Converting from water ring pumps to oil ring pumps eliminate water use altogether. Where steam must be used, recirculation is increasingly becoming common (Scaramelli and Cohen 2002).
[8] Oil-ring vacuum pumps currently dominate 80 percent of the market, about 17 percent are oil-less, and roughly 3 percent are still water-ring pumps (Britain 2002).

Estimate of Potential Savings

By applying the conservation potential calculated in the end use studies (see Appendix D) and Table E-11 to our GED-derived estimates of water use, we estimated potential water savings (shown in Table E-12).

Table E-12
Potential Water Savings in the Hospital Industry (2000)

End Use	Water Use (TAF)	Conservation Potential (percent)			Conservation Potential (TAF)		
		Low	**High**	**Best**	**Low**	**High**	**Best**
Cooling	9.6	9%	41%	26%	0.9	4.0	2.5
Restrooms	9.2	47%	47%	47%	4.3	4.3	4.3
Process	8.1	39%	57%	52%	3.1	4.6	4.2
Landscaping	5.9	38%	53%	50%	2.2	3.1	2.9
Kitchen	2.9	20%	20%	20%	0.6	0.6	0.6

	36.7	**31%**	**46%**	**40%**	**11.4**	**16.8**	**14.8**

Laundries (SIC code 721)

SIC code 721 consists of a range of facilities that include carpet and upholstery cleaners, large linen rental companies, and a variety of laundries, including industrial laundries that clean rags used to wipe inks and solvents off equipment. We include all laundries except SIC code 7215, coin laundries. Table E-13 shows employment and gallons per employee per day coefficients. Figure E-4 shows laundry end-use estimates. As expected, most water use in this industry goes to washing clothes, though about 15% goes to other end uses.

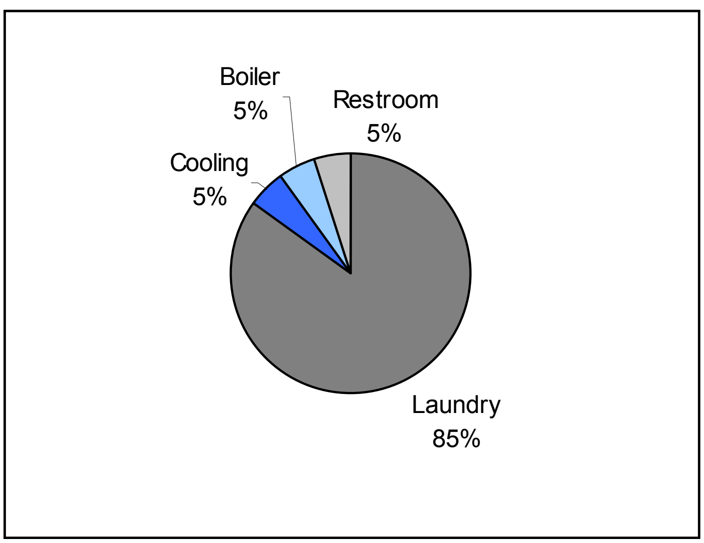
Table E-13
Employment and Water Use in the Laundry Industry (2000)

Sub-industry	SIC code	GED[1,2]	Employees	Annual Use (TAF)
Dry cleaning & laundry	7216	981	21,410	14.5
Linen supply	7213	977	7,860	5.3
Carpet & upholstery	7217	984	5,890	4.0
Industrial launderers	7218	981	9,150	6.2
Total	**49,965**		**44,310**	**30.0**

[1] Based on a 225-day year.
[2] Note that the GED coefficients estimated for 1995, were decreased by 20% to obtain the GED coefficients for 2000 for the commercial sector.

In the laundry industry, water is used primarily to remove soil and odors from textiles through laundering and very little water (<15 percent) is used for other purposes.

Figure E-4
Water Use, by End Use, in the Laundry Industry



Source: Based on average of two laundry case studies (AWWARF 2000)

Estimate of Potential Savings

By applying the conservation potential calculated in the end use studies (see Appendix D) to our GED-derived estimates of water use, we estimated potential water savings (as shown in Table E-14).

Table E-14
Potential Water Savings in the Industrial Laundry Industry (2000)

	Water Use (TAF)	Conservation Potential (percent)			Conservation Potential (TAF)		
End Use		**Low**	**High**	**Best**	**Low**	**High**	**Best**
Laundry	25.5	42%	66%	54%	10.8	16.9	13.8
Cooling	1.5	9%	41%	26%	0.1	0.6	0.4
Boiler[1]	1.5	0%	25%	10%	0.0	0.4	0.2
Restroom	1.5	34%	34%	34%	0.5	0.5	0.5
Total	**30.0**	**38%**	**61%**	**49%**	**11.4**	**18.4**	**14.8**

[1] Assumed Range

Restaurants (SIC code 58)

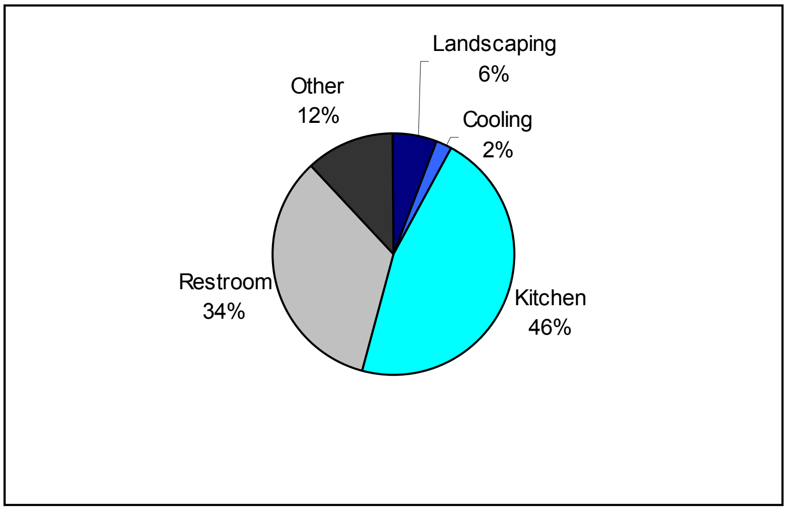
Water is used in restaurants primarily for kitchen purposes, such as washing dishes, making ice, and preparing food (see Appendix D for a description of these uses). A significant amount of water is also used for restrooms. Table E-15 and Figure E-5 provide our estimates of total water use in the restaurant industry by end use.

Table E-15
Employment and Water Use in the Restaurant Industry (2000)

Industry	**SIC code**	**GED[1,2]**	**Employees**	**Annual Use (TAF)**
Restaurants	58	265	890,600	163.0

[1] Based on a 225-day year.
[2] Note that the GED coefficients estimated for 1995, were decreased by 20% to obtain the GED coefficients for 2000 for the commercial sector.

Figure E-5
Water Use, by End Use, in the Restaurant Industry



Source: Calculated from MWD audit data of 89 restaurants (MWD 2002).

Comparison of GED-derived Estimate to Modeled Water Use

We modeled water use in restaurants using published estimates of restroom visits by employees and customers, irrigated turf area, cooling requirements, dishwashing water use etc. We converted our GED-derived estimate of water use per employee into water use per meal and then compared it to that predicted by the water use model. To convert the GED-derived estimate, we first divided the amount of water used in the restaurant sector in 2000 by the number of meals eaten to calculate the average gallons/meal/day.

Because the number of meals eaten at California restaurants per day was not available, we estimated this number with two different methods (see Tables E-16 and E-17).

Table E-16
Number of Meals Served in California (2000), Method One

Data	Source	Value (2000)
A) Employees in California	US Census Bureau	895,000
B) Meals/employee/day	Average of restaurants[1]	15
C) Total meals/day in California	A*B	13,500,000
D) Percentage of drive-through meals	Restaurant USA	18%
E) Take out meals/day	C*D	2,400,000
F) Sit down meals/day	C-E	11,100,000

[1] Average of data from several case studies (LADWP, 1991 (a & b), MWD, 1992, MWRA, 1990)

Table E-17
Number of Meals Served in California (2000), Method Two

Data	Source	Value (2000)
A) Population in California in 2000	US Census Bureau	33,800,000
B) Meals eaten out/week	Restaurant USA	4.2
C) Total meals/day in California	A*B/7	18,200,000
D) Fraction of meals eaten at cafeterias (not in SIC code 58)	Fraction of establishments not included in SIC code 58	25%[1]
E) Meals in SIC code 58	C*(1-D)	13,700,000
F) Percentage of drive-through meals	Restaurant USA	18%
G) Number of drive-through meals	D*E	2,500,000
H) Sit-down meals/day in restaurants	D-F	11,200,000

[1] We used the number of establishments (74,000) published by the California Restaurants Association (www.calrest.org). The number listed under SIC code 58 (57,000), is about 77 percent of the total restaurants.

To model the water use in a medium-sized restaurant, we considered a food establishment with 25 employees and 60 seats. The meal turnover industry average of 5 meals/seat/day (or 250 meals/day) (LADWP, 1991 (a & b), MWD, 1992, MWRA, 1990) was applied to end-use data from Appendix D.

Table E-18
Modeled Daily Water Use in Restaurants (2000)

Water End Use	Volume[1]	Times Per Day[1]	Use Gal/Day	Use Gal/Meal/Day	Use Efficient Gal/Meal/Day[2]
Dishwasher					
Pre-rinse nozzles	2.5 gpm	60 min	150	0.6	0.40
Pot and pan sink	40 gal	3 sinks * 2 fills[3]	300	1.20	1.20
Garbage disposal	4.5 gpm	30 min	135	0.54	0.20
Dishwasher	2.4 gal/rack	0.5 racks/meal, 70 percent capacity[4]	429	1.71	0.79
Restrooms[5]					
Employee use restrooms	2.8 gal/visit	25 employees * 4.6 visits/day gal/day	322	1.3	0.72
Customer use restrooms	2.7 gal/visit	250 customers *50 percent of customers	338	1.4	0.79
Food Prep					
Preparation sink	15 gal	2 fills/day	30	0.12	0.12
Water used in food	0.5 gal/meal	250 meals/day	125	0.50	0.50
Icemaker					
Ice maker	1 gal/lb[6]	1.5 lb/meal[7]*250 meals	338	1.5	1.2
General Sanitation					
Floor wash	12 gal/clean	3 cleans[8]	36	0.14	0.14
Other[9]	30 gal		125	0.50	0.50
Miscellaneous	100 gal		100	0.40	0.40
Total			**25,607**	**9.91**	**6.96**

[1] Volume and use were estimated from data in several case studies (LADWP, 1991 (a & b), MWD, 1992, MWRA, 1990), except where otherwise noted.
[2] See Appendix D
[3] Three pot sinks of 50 gallons capacity are filled and emptied twice daily.
[4] The amount of dishes generated was assumed to be 2.5 racks/guest (Bohlig 2002).
[5] See Appendix D.

[6] Ice used per meal was about 1.5 lbs and icemaker water use of 1 gal/lb was assumed (note that one gallon of water produces only one pound of ice because, during the process, several gallons are lost to bleed-off.
[7] ASHRAE 1994
[8] Assuming the restaurant uses about 25 gallons each time it cleans the floor and counters and it does this twice daily.
[9] The restaurant uses 100 gallons daily in other uses including laundry and landscaping (about 5 percent of total use). The restaurant does not have a cooling tower.

Our comparison of the GED-derived and modeled estimates is shown in Table E-19 below.

Table E-19
Comparison of Estimates of Water Use in a Typical Restaurant

	GED-derived (gallons/meal)	Model 1 (typical use)	Model 2 (efficient use)
Total	12.9[1]	9.9	7.0

[1] Using 163 TAF in 2000 for SIC code 58 and dividing this by the number of meals per day and then by 365 days in a year, we got about 12.9 gal/meal.

Estimate of Potential Savings

By applying the conservation potential calculated in the end use studies (see Appendix D) to our GED-derived estimates of water use, we estimated potential water savings (shown in Table E-20).

Table E-20
Potential Water Savings in the Restaurant Industry (2000)

	Water Use (TAF)	Conservation Potential (percent)			Conservation Potential (TAF)		
End Use		**Low**	**High**	**Best**	**Low**	**High**	**Best**
Landscaping[1]	9.8	38%	53%	50%	3.7	5.2	4.9
Cooling	3.3	9%	41%	26%	0.3	1.4	0.8
Kitchen	75.0	20%	20%	20%	14.9	14.9	14.9
Restrooms	55.4	46%	46%	46%	25.2	25.2	25.2
Other[2]	19.6	0%	25%	10%	0.0	4.9	2.0
Total	**163.0**	**27%**	**32%**	**29%**	**44.0**	**51.5**	**47.7**

[1] Based on our modeled landscaping use, we assumed that about 18 TAF, or 4 percent, of total restaurant use is used for landscaping. The remaining 13 TAF, or 6 percent, of the other/landscaping category was used for other purposes. See Appendix D for more information on landscaping.
[2] Range assumed

Retail Stores (SIC codes 53, 54, 55, 56, 57, 59)

Retail stores include grocery stores, department stores, gas stations, and non-store retailers (i.e., retailers who work from home). In 2000, there were nearly 800,000 retail stores in the state. Due to known differences in water use, we categorize retail establishments as grocery stores or "miscellaneous retail" stores. These are shown in Table E-21 and Figure E-6 and Figure E-7.

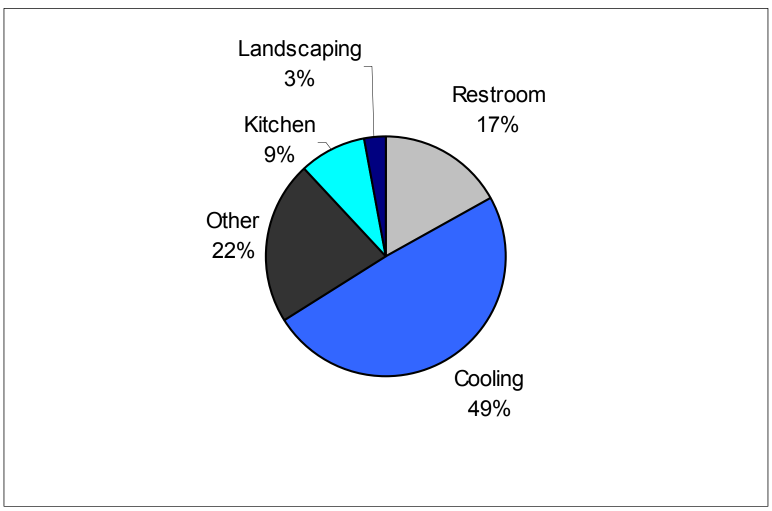
Table E-21
Employment and Water Use in the Retail Industry (2000)

Sub-industry	SIC code	GED[1,2]	Employees	Annual Use (TAF)
Grocery	540	170	293,224	34.5
Misc. Retail	53,55,56,57,59	152	1,128,210	118.1
Total			**1,421,434**	**153.0**

[1] Based on a 225-day year.
[2] Note that the GED coefficients estimated for 1995, were decreased by 20% to obtain the GED coefficients for 2000 for the commercial sector.

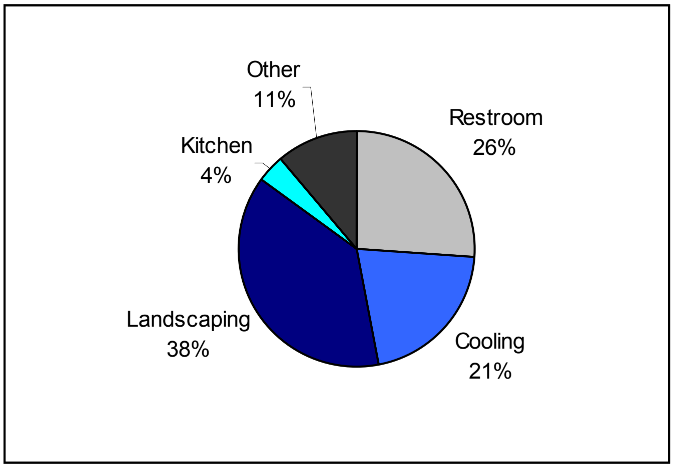
Retail stores use water in kitchens and restrooms and for cooling and irrigation. Although no process water is typically used in the Retail industry, water use varies considerably among the different types of retail stores. For example, grocery stores use water more intensively than other retail stores because they have sinks and dishwashing nozzles in meat and deli departments, misters to keep produce moist, and ice makers. In contrast, department and other retail stores use water mostly for restrooms and space cooling.

Figure E-6
Water Use, by End Use, in the Grocery Sub-industry



Source: Calculated from MWD audit data of 45 grocery stores (MWD 2002).

Figure E-7
Water Use, by End Use, in Misc. Retail Sub-industries



Source: Calculated from MWD audit data of 38 miscellaneous retail stores (MWD 2002).

Comparison of GED-derived Estimate to Modeled Water Use

We could not create a complete model of typical water use because of data insufficiency on kitchen and cooling water use in retail establishments. However, we did compare our GED-derived estimates to some of the various end uses that were calculated in Appendix D, as shown in Table E-22.

Table E-22
Comparison of Estimates of Annual Water Use in the Retail Industry

End Use	Modeled End Use	GED-derived Use
	(TAF)	
Kitchen	n/a	7.8
Restrooms	22.5	36.6
Cooling	n/a	41.7
Landscaping	33.7	45.9
Other	n/a	20.6
Total		**153**

Estimate of Potential Savings

By applying the conservation potential calculated in the end use studies (see Appendix D) to our GED-derived estimates of water use, we estimated potential water savings (shown in Table E-23).

Table E-23
Potential Water Savings in Grocery Stores (2000)

Grocery End Use	Water Use (TAF)	Conservation Potential (percent)			Conservation Potential (TAF)		
		Low	High	Best	Low	High	Best
Restroom	5.9	51%	51%	51%	3.0	3.0	3.0
Cooling	16.9	9%	41%	26%	1.6	7.0	4.3
Landscaping	1.0	38%	53%	50%	0.4	0.5	0.5
Other	7.6	0%	25%	10%	0.0	1.9	0.8
Kitchen	3.1	20%	20%	20%	0.6	0.6	0.6
Total	**34.5**	**16%**	**38%**	**27%**	**5.6**	**13.1**	**9.2**

Table E-24
Potential Water Savings in the Other Retail Stores (2000)

Misc. Retail End Use	Water Use (TAF)	Conservation Potential (percent)			Conservation Potential (TAF)		
		Low	High	Best	Low	High	Best

Schools (SIC codes 8219, 9382)

There are 8,330 public and 4,370 private schools in California, including elementary, middle, high, continuing, and vocational schools. Total enrollment (public and private) was 4.73 million in elementary and middle schools, 1.85 million in high schools, and 2.20 million in other[3] types of schools (CDE 2002, California Postsecondary Education Commission 2002).

Table E-25
Employment and Water Use in Schools (2000)

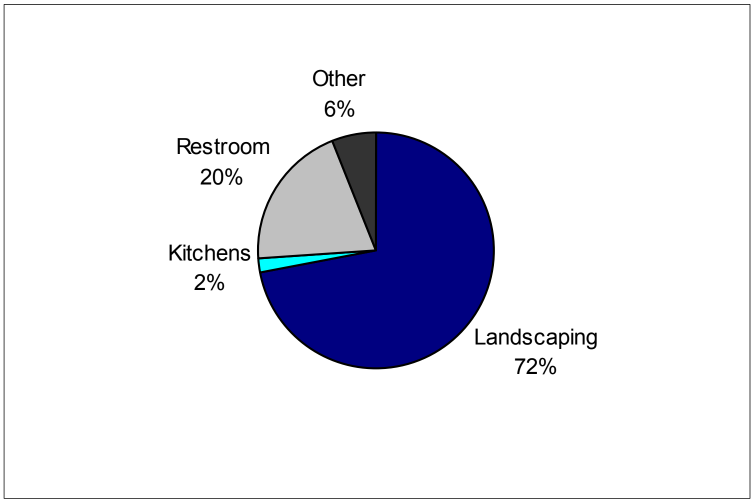
Sub-industry	SIC	GED[1,2]	Employees	Annual Use (TAF)
K-12		308	1,009,130	214.6
Other		190	280,200	36.7
Total			**1,289,300**	**251.3**

[1] Based on a 225-day year.
[2] Note that the GED coefficients estimated for 1995, were decreased by 20% to obtain the GED coefficients for 2000 for the commercial sector.

Although most schools use water for restrooms, cooling and heating, irrigation, and kitchens, the percentage of water consumption devoted to different end uses varies among schools. The most significant difference appears to result from the large use of irrigation water in schools with athletic fields. High schools generally have more irrigated athletic field area per student than elementary schools or other types of schools. Because the end use percentages can vary greatly among the different types of schools, we analyzed water use in elementary/middle schools, high schools, and other schools separately (see Figures E-8 and E-9).[4]

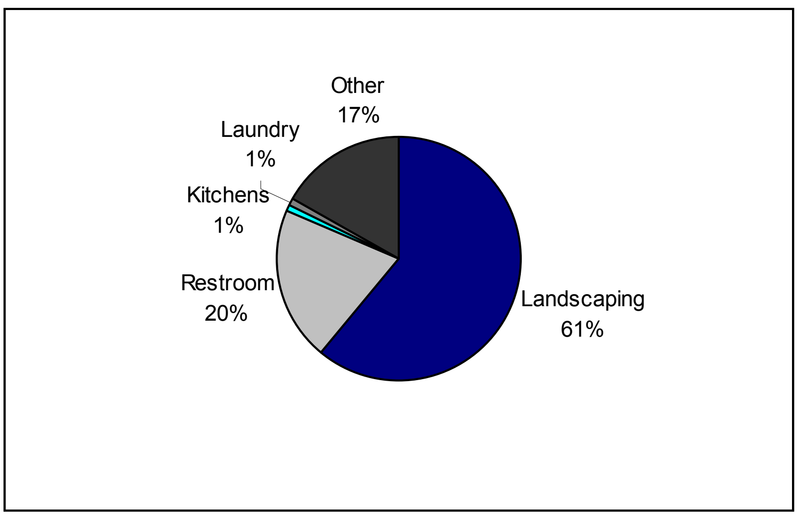
[3] Other types of schools, as referred to herein, include colleges, universities, trade schools, and other non-K-12 schools.
[4] In some cases we had enough data to also analyze elementary and high schools separately.

Figure E-8
Water Use, by End Use, in K-12 Schools



Source: Calculated from MWD audit data of 149 schools (MWD 2002).

Figure E-9
Water Use, by End Use, Other Schools



Source: Calculated from MWD audit data of selected non-K-12 schools (MWD 2002).

Comparison of GED-derived Estimate to Modeled Water Use

We modeled water use in schools using published estimates of restroom visits by students and staff, irrigated turf area, cooling requirements, etc. We converted our GED-derived estimate of water use per employee into water use per student per day and then compared it to that predicted by the water use model. The end use calculations in the GED-derived estimate are from Figures E-8 and E-9 and the model's assumptions are derived from the end-use data in Appendix D. Table E-26 shows the results.

Table E-26
Modeled Water Use per Student

End Uses	Unit Measuring Area or Volume of Use	Area or Volume	Unit Measuring Frequency of Use	Frequency of Use	Total gal/ student/ day
Elementary and Middle Schools					
Irrigation[1]	irrigated acres/student	0.004	gal/acre/school day	varies	24.3
Toilet[2]	gpf	3.00	visits/day	2.11	6.3
Urinal[3]	gpf	1.60	visits/day	1.01	1.6
Faucet Use[4]	gpf	0.11	flushes/day	3.12	0.3
Kitchen	gal/meal	9.91[5]	meals/day/student	0.4[6]	4.0
Other[7]					2.0
Total					**38.5**
High Schools					
Irrigation[1]	irrigated acres/student	0.008	gal/acre/school day	varies	55.6
Toilet[2]	gpf	3.00	visits/day	2.11	6.3
Urinal[3]	gpf	1.60	visits/day	1.01	1.6
Faucet Use[4]	gpf	0.11	flushes/day	3.12	0.3
Kitchen	gal/meal	9.91[5]	meals/day/student	0.4[6]	4.0
Other[7]					4.0
Total					**71.8**
Other Schools					
Irrigation	irrigated acres/student	0.002	gal/acre/school day	varies	6.9
Toilet[8]	gpf	3.00	visits/day	1.03	3.1
Urinal[9]	gpf	1.60	visits/day	0.39	0.6
Faucet Use	gpf	0.11	min/day	0.96	0.1
Kitchen	gal/meal	9.91	meals/day/student	0.4	4.0
Other					1.0
Total					**15.7**

1

2 Assuming that each K-12 student and staff uses the toilet 1.95 times per day (see Appendix D) and a student-staff ratio of about 11.8 (based on student enrollment obtained from the Educational Demographics Office (2002) and employment data from California Employment Development Department (2002), we calculated 2.11 daily toilet visits per K-12 student.

3 Assuming that each K-12 student and staff uses urinals 0.94 times per day (see Appendix D) and a student-staff ratio of about 11.8 (Based on Student Enrollment obtained from the Educational Demographics Office (2002) and Employment Data from California Employment Development Department (2002)), we calculated 1.01 daily urinal visits per student.

4 Faucet use was based on the number of daily toilet and urinal flushes reported above.

5 Average gal/meal was obtained from the model in Appendix D.

6 The USDA estimated that there were about 489 million school meals served in 2000 (about 2.7 million meals per day). The total enrollment in California's public and private schools is about 6.6 million, implying about 40 percent of students have cafeteria meals.

7 Other use is estimated at 5 percent of total use and includes cooling, pools, etc.

8 Assuming that each non K-12 student uses the toilet 0.86 times per day and staff uses the toilet 1.95 times per day and a student-staff ratio of 11.8, we calculated 1.03 daily visits per non K-12 student.

9 Assuming that each non K-12 student uses urinals 0.31 times per day and staff uses them 0.94 times per day and a student-staff ratio of 11.8, we calculated 0.39 daily visits per student.

Table E-27
Comparison of Estimates of Water Use in Typical Schools

	GED-Based Estimate[1]	Modeled Estimate
	(gal/student/day)	
Elementary and middle schools	48.1	38.5
High schools	87.4	71.8
Other schools	30.5	15.8

[1] Based on the assumption that elementary and middle school students use 55 percent of the water used by high schools students (see Table E-26), we converted elementary and middle students into 2.60 million "additional" high school students. We then divided total K-12 water use (215 TAF) by the number of high school students plus the "additional" high school students to yield 87.43 gallons/high school student/school day. Then, we took 55 percent of the high school use in gal/student/day to get gallons/K-8 student/day. For gallons/other student/day, we divided total other use by the number of other students and then by the number of school days.

Estimate of Potential Savings

By applying the conservation potential calculated in the end-use studies (see Appendix D) to our GED-derived estimates of water use, we estimated potential water savings (shown in Table E-28 and E-29).

Table E-28
Potential Water Savings in K-12 Schools (2000)

K-12 End Uses	Water Use (TAF)	Conservation Potential (percent)			Conservation Potential (TAF)		
		Low	High	Best	Low	High	Best
Landscaping	154.5	38%	53%	50%	58.1	81.6	77.1
Kitchens	4.3	20%	20%	20%	0.9	0.9	0.9
Restroom	42.9	45%	45%	45%	19.4	19.4	19.4
Other	12.9	0%	25%	10%	0.0	3.2	1.3

Appendix F

Details of Industrial Water Use and Potential Savings, by Sector

Meat Processing (SIC code 201)

The Meat Processing industry includes establishments primarily engaged in packing meat, manufacturing sausages and other prepared meat products, and poultry slaughtering and processing. Table F-1 shows water-use coefficients and total estimated water use in this sector in 2000. Figure F-1 shows water use in this sector by end use. Most water goes to processing meat, though a substantial amount is also used for cooling.

Table F-1
Employment and Water Use in the Meat Processing Industry (2000)

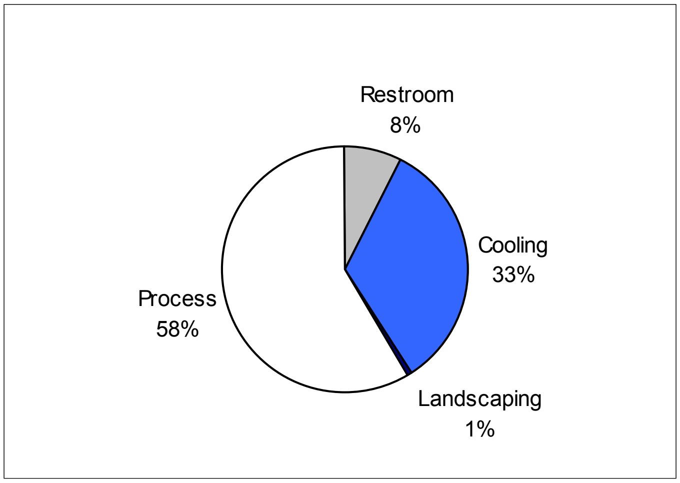
Sub-industry	SIC code	Employees	GED[1,2]	Water Use (TAF)
Poultry processing	2015	7,110	1,365	6.7
Animal (except poultry) slaughtering	2011	4,170	1,477	4.3
Seafood (estimated)	2011	2,790	772	1.5
Meat processed from carcasses	2013	4,930	772	2.6
Total	**201**	**19,000**	**1,149**	**15.1**

[1] Based on a 225-day year.
[2] The GEDs estimated for 1995, were decreased by 6% to obtain the GED coefficients in 2000, for the industrial sector.

Water Use

Meat Processing plants use water primarily for sanitizing animal holding areas, scalding, meat washing, chilling, waste fluming, and cleaning and disinfecting equipment. The industry is heavily regulated and in 1998 it implemented new regulations, called Hazardous Analysis Critical Control Points (HACCPs), which specify the minimum amount of water required for specific operations, such as scalding and chilling. Due primarily to these regulations, water-use intensity (gallons of water per animal or bird processed) has actually increased since the late nineties (Woodruff 2000).

Figure F-1
Water Use, by End Use, in the Meat Processing Industry



Source: Calculated from MWD audit data of two meat-processing plants (MWD 2002).

Process Water Conservation Potential in Poultry Processing

While qualitative information on process water use and potential savings in the Meat Processing industry was available, quantitative data on water use for sanitation, chilling, and scalding and penetration rates were limited.

Sanitation

Information on potential sanitation savings in poultry processing included:

- Poultry plants in California are largely located in the Central Valley where water and sewer charges are comparatively low. Data from one case study indicated that while significant savings are possible from basic improvements in housekeeping techniques, these are not economical in the absence of higher wastewater charges (North Carolina Cooperative Extension 1999).
- Some plants are still using water extremely inefficiently because plant managers do not want to risk implementing water conservation measures at the expense of having the plant shut down under the 1998 HACCP regulations (Woodruff 2000). Consequently, the productivity of water use in this sector has actually declined in recent years.
- Potential savings from good housekeeping appear to be moderate in California's Meat Processing Industry (Lelic, personal communication, 2002).

Based on the information listed above, we assumed that potential savings from various sanitation measures could range anywhere from 20 to 80 percent, although the sources seemed to point toward the lower end of this range. Consequently, we chose 40 percent as our best estimate of typical savings per site.

Chilling and Scalding

In addition to savings from sanitation, some poultry processing plants are using bubbled accelerated floatation (BAF), ultra-filtration, ozone treatment, and recycling for the clean up and recycling of poultry chilling and scalding water. Chilling and scalding water use can be decreased by up to 80 percent with these techniques and (Carawan and Sheldon 1989), to remain conservative in our estimates; we assumed 70 percent per site. The penetration rate of these technologies was estimated at 30% based on the results of the 1997 CIFAR Survey (Pike 1997). The survey indicated that water reuse technologies averaged about 25% in the "All" Category. Since Fruit and Vegetable Processors had much higher penetration rates, meat and poultry were estimated to have lower penetration rates.

Process Water Savings in the Meat Processing Industry

We used the above information about poultry processing to calculate potential process water savings in the Meat Processing industry as a whole, as shown below in Table F-2

Table F-2
Potential Process Water Savings at a Meat Processing Plant (2000)

Process Sub-end Use	Measure	Sub-end Use (x percent)[2]	Site Savings (c percent)	Penetration Rate (p percent)	Savings Potential (s percent)[5]
Sanitation	Good housekeeping	(60%)	40%[3]	(40%[3,4])	29%
Chilling	Recirculate water	(10%)	70%[6]	(20%[7])	65%
Scalding	Recirculate water	(10%)	No Savings	N/A	N/A
Utility		(20%)	No Savings	N/A	N/A
Total process savings potential		**100%**	**23%[8]**		

[1] Note that savings in the a meat processing plant are taken from our estimate of savings in a poultry processing plant.
[2] This breakdown is a guess – no data was available.
[3] Estimated from conversations with Lelic (2002).
[4] Estimated from the general industry feeling (conveyed by Woodward (2002) and the industry literature) that HACCP regulations are preventing the implementation of some of these measures.
[5] Percent Savings Potential = Savings * (1-Penetration)/ (1- Savings*Penetration Rate)
(See Appendices C and D for derivation)
[6] Estimated from data presented by the North Carolina Cooperative Extension (1999).
[7] Estimated based on overall application of reuse of cooling water, rinse, wash water etc. from the 1997 CIFAR Survey
[8] Σx% * s%. (See Appendices C and D for derivation)

Estimate of Potential Water Savings

The conservation potential for common end uses was calculated in the end use studies (see Appendix C) and then applied to our GED-derived estimate of water use to get potential water savings for these end uses. To get the conservation potential for the Meat Processing industry's process water use, we used data from poultry processing (see Table F-1 above). A sensitivity analysis was applied to our best guess penetration rates to obtain a high and low estimate.

Table F-3
Potential Water Savings in the Meat Processing Industry (2000)

End Use	Water Use (TAF)	Conservation Potential (percent)			Potential Savings (TAF)		
		Low	High	Best	Low	High	Best
Process	8.8	14%	29%	25%	1.2	2.5	2.2

Cooling	5.0	9%	41%	26%	0.5	2.1	1.3
Restroom	1.1	49%	49%	49%	0.6	0.6	0.6
Landscaping	0.1	38%	53%	50%	0.0	0.1	0.1
Total	**15.1**	**15%**	**35%**	**27%**	**2.3**	**5.2**	**4.1**

Comparison with Industry Benchmarks

To crosscheck our estimate of conservation potential, we estimated the amount of water necessary to process one animal and compared it to industry efficiency benchmarks from the North Carolina Department of Environment and Natural Resources (NCDENR et al. 1998). Unfortunately, we had benchmarks for only cattle and broilers and we had to estimate water requirements for processing hogs, sheep, and turkeys. We made the following assumptions[1]: processing a hog required about one-fifth the water used to process one head of cattle; processing a sheep required about one-eighth the water used to process one head of cattle; and processing turkeys required twice as much water per bird as broilers. When we compared our calculated use to what is considered efficient water use industry-wide (see Table F-4 below), we found that total water use in California's Meat Processing industry could be reduced by 33 to 50 percent if all plants operate at the maximum level of efficiency.

Table F-4
Comparison of Estimated Water Use to Efficient Water Use in Meat Processing

Sub-industry	**Water Use in 1995 (TAF)**	**Production [1]**	**Efficient Water Use (gal/head)**	**Estimated Water Use (gal/head)**
Poultry	Broiler – 6.5 Turkey – 1.2 Chicken – 0.4	22 Mn Turkey 235 Mn Broilers 13 Mn Chicken	Gal / Bird [2] Broiler – 6.0 Turkey – 12.0	Gal / Bird Broiler – 9.0 Turkey – 18.0
Animal Slaughter	Beef Cattle – 1.8 Hogs/Pigs – 0.25 Sheep – 0.05	1.9 Mn Cattle 1.2 Mn Hogs 0.38 Mn Sheep	Gal/ Head 150 [3]	Gal/Head Cattle –300 Hogs – 60 Sheep – 40

[1] California Agricultural Statistical Services 1995
[2] Woodruff (2000) states that under the new health guidelines it is unlikely that water use can return to the 4 gal/bird efficiency benchmark mentioned in the North Carolina CII Water Efficiency Manual (1998) and that a benchmark of 6 gal/bird is more realistic
[3] NCDENR et al. 1998

[1] We based these assumptions on the ratio of their average weights (National Agricultural Statistics Service 2000).

Dairy Products (SIC code 202)

Industry Description

The Dairy industry includes establishments primarily engaged in manufacturing: butter; cheese; dry, condensed, and evaporated milk;[2] ice cream and frozen dairy desserts; and special dairy products. SIC code 202 covers only milk processing plants and not dairy farms.

Table F-5
Employment and Water Use in the Dairy Products Industry (2000)

Sub-industry	SIC code	Employment	GED[1,2]	Water Use (TAF)
Creamery butter	2021	540	5,319	2.0
Cheese, natural and processed	2022	4,200	2,078	6.0
Dry, condensed products	2023	2,380	1,071	1.8
Ice cream and frozen desserts	2024	2,350	1,071	1.7
Fluid milk	2026	6,540	1,292	5.8
Total	**202**	**16,010**	**1,568**	**17.3**

[1] Based on a 225-day year.
[2] The GEDs estimated for 1995, were decreased by 6% to obtain the GED coefficients in 2000, for the industrial sector.

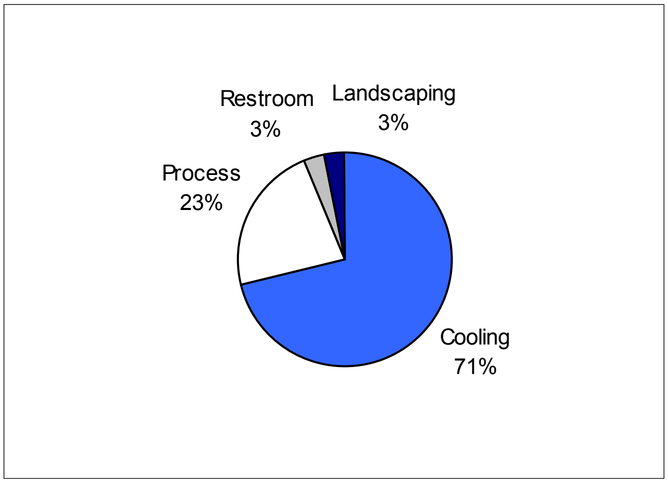
Water Use

The Dairy industry uses water primarily for cooling and, to a lesser degree, for the following process uses (see Figure F-2):

- Sanitize equipment and work areas (industry sanitation standards require that all equipment in contact with a fluid food product must be cleaned every 24 hours);
- Heat and boil milk and milk products;
- Product cooling.

[2] This includes plants that pasteurize, homogenize, add vitamins to, and bottle fluid milk for wholesale or retail distribution.

Figure F-2
Water Use, by End Use, in the Dairy Products Industry



Source: Calculated from MWD audit data of three dairy processing plants (MWD 2002).

Process Water Conservation Potential

California's Dairy industry has not been surveyed since the 1970s and, therefore, actual penetration rates of various water conservation technologies were not available. All penetration rate information obtained for the Dairy industry was estimated from discussions with industry experts and various reports (see Table F-6 below).

Table F-6
Process Water Savings in a Dairy Processing Plant

Measure	Process Water Saved (percent)	Penetration Rate
Eliminate continuous running of carton cleaning water		Most plants[1]
Recirculate carton cleaning water		
Recirculate carton cooling water		
Reverse osmosis of pre-rinse effluent to recover by-product and water	4%[2]	Potential for most plants[2]
Optimize process runs		Most plants[1]
Collect tank acid rinse water to use as pre-wash in next cleaning cycle		No plants (too expensive)[2]
Reuse cow water in nondairy operations like cooling towers and boilers	25%[3]	
Use a reverse osmosis system to upgrade the "cow water" to potable quality	50-60%[3]	Few plants (expensive)
Reverse osmosis to recover water from whey		Few plants

[1] Bruhn, personal communication, 2002.
[2] CIFAR (1995b).
[3] Estimated from data presented in Pequod Associates (1992).

Table F-7
Potential Process Water Savings in the Dairy Processing Industry (2000)

Sub-end Use	**Measure**	**Sub-end Use (x percent)[1]**	**Savings (c percent)**	**Best Est. Penetration Rate (p percent)[2]**	**Savings Potential[3] (s percent)**
Carton washing	Eliminate continuous flow, recirculate carton cleaning and washing water	7%	(30%)[4]	90%	4%
Cold storage	Use cow water	3%	25%	70%	30%
Utilities	Use cow water	35%	25%	70%	30%
Sanitation of equipment, filling room, receiving[6]	Recycle dilute rinses, optimize runs to clean less often, upgrade cow water through reverse osmosis to replace potable water	50%	(10%)[4] (10%)[4] 60%[5]	20% 70% 20%	28%
Consumptive	none	5%	0%		
Total process savings potential = Σ x% * s%[7]		**100%**	**25%**		

[1] Estimated from data presented in Carawan et al. (1979) and Danish EPA (1991)
[2] All penetration rates are developed from the qualitative information described in Table F-6. Thus 90% = "Very High/Most Plants", 70% = "High", 20% = "Low"
[3] Percent Savings Potential = Technology Savings * (1-Technology Penetration Rate)/ (1-Savings*Penetration Rate)
[4] Estimate from MnTAP 1994b.
[5] Calculated from data presented in Pequod Associates (1992).
[6] These technologies are complementary, so the overall savings are additive.
[7] see Appendices C and D for derivation

By applying penetration rates from various case studies, the range of the savings in process water was estimated to be between 19 and 28 percent.

Estimate of Potential Water Savings

The conservation potential for common end uses was calculated in the end use studies (see Appendix C) and then applied to our GED-derived estimate of water use to get potential water savings for these end uses. We used data from Table F-7 above for the estimate of potential process water savings (Table F-8).

Table F-8
Potential Water Savings in the Dairy Processing Industry (2000)

	Water Use (TAF)	**Conservation Potential (percent)**			**Potential Savings (TAF)**		
End Use		**Low**	**High**	**Best**	**Low**	**High**	**Best**
Cooling	12.3	9%	41%	26%	1.2	5.1	3.2
Process	4.0	20%	28%	25%	0.8	1.1	1.0
Restroom	0.5	49%	49%	49%	0.3	0.3	0.3

Landscaping	0.5	38%	53%	50%	0.2	0.3	0.3
	17.3	**14%**	**39%**	**27%**	**2.4**	**6.8**	**4.7**

Comparison with Industry Benchmarks

Our estimate of conservation potential in the Dairy industry was crosschecked against industry benchmarks of water use per gallon of milk produced (Table F-9).

Table F-9
Water Use per Gallon of Milk Produced

Water Use	**Gal/gal of Milk[1,2]**	
	1970's	**1990's**
Efficient	2.28	0.5-1.0[3]
Median	3.35	1.4-2.6
High	9.74	

[1] COWI 1991 (reported in liters)
[2] Using 1 gallon of water = 3.78 liters, 1 gallon of milk = 3.9 kg
[3] Bough and Carawan 1992; NC Division of Pollution Prevention and Environmental Assistance 1998 (http://www.p2pays.org/ref/01/0069206.pdf).

About 660 million gallons of milk were used to produce fluid milk in 2000 (California Dairy Forum 2000). From the GEDs we estimated that about 5,750 AF of water was used in fluid milk manufacturing in that year and this translates to roughly 2.8 gallons of water per gallon of milk produced. Given this water consumption, potential water savings could be as high as 65 percent, indicating that our estimate of 16 percent in 2000 is possibly a conservative estimate.

Preserved Fruits and Vegetables (SIC 203)

Industry Description

The Preserved Fruits and Vegetables industry includes processing fresh produce in the following ways: canning (SIC codes 2032 and 2033); dehydration (SIC code 2034); freezing (SIC codes 2037 and 2038); and pickling (SIC code 2035). Fruit and vegetable canning (SIC code 2033) accounts for half of the water used by SIC code 203. Tomato processors constitute the single largest sub-industry, using an estimated 30 percent of the industry's total water use. Peaches, olives, apricots, and pears are among the most important fruits and vegetables processed. Table F-10 shows water coefficients and total water use in SIC code 203. Figure F-3 shows water use by end use. Most water goes to process requirements.

Table F-10
Employment and Water Use in the
Preserved Fruits and Vegetables Industry (2000)

Sub-industry	SIC code	GED[1,2]	Employees	Water Use (TAF)
Preserved Fruit and Vegetables	203	2,487	40,500	69.5

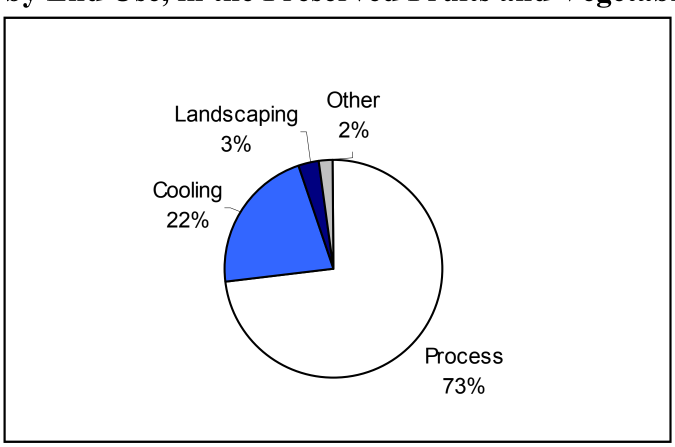
[1] Average across all regions, based on a 225-day year.
[2] The GEDs estimated for 1995, were decreased by 6% to obtain the GED coefficients in 2000, for the industrial sector.

Water Use

Process water is used in the Fruit and Vegetables industry to:

- Clean fruits and vegetables;
- Move produce into the plant;
- Sanitize the peeling, dicing, and other equipment;
- Move waste into the sewers; and
- Sanitize floor and storage areas.

Figure F-3
Water Use, by End Use, in the Preserved Fruits and Vegetables Industry



Source: Calculated from MWD data of one fruit and vegetable processing plant (MWD 2002).

Process Water Conservation Potential

A 1997 report by the California Institute of Food and Agriculture appears to be the best and most recent indicator of penetration rates of water efficient technologies in this industry (Pike 1997). Although the survey is not a random sample, it presented the most comprehensive indicator of penetration rates.[3] The survey showed that fruit and vegetable canning plants have already implemented several conservation measures (see Table F-11).

Table F-11
Implementation of Process and Cooling Water Conservation Technologies at a Fruit and Vegetable Cannery

Measure	Percent Implementing Measure between 1994 and 1997
Process Water	
Self-closing nozzles	42%
Reuse non-contact cooling water	58%
Recycle steam condensate	48%
Reduce wastewater to recapture product	32%
Sanitize reconditioned water for contact use	18%
Reuse rinse water	25%
Cooling Water	
Eliminate single pass cooling	42%
Improve cooling tower efficiency	25%
Change to air cooling	8%

Source: Pike 1997

We applied the findings on conservation technologies in canneries, as shown in Table F-11, to the entire Processed Fruit and Vegetable industry (see Table 4.C.3.3 below).

Table F-12
Potential Process Water Savings in the Preserved Fruit and Vegetables Industry

Sub-end Use	Measure		Savings[1]	Penetration Rate[2]	Potential
Cleaning of produce and equipment	Self-closing nozzles	75%	(30%)	42%	20%
	Reduce wastewater to recapture product		(10%)	32%	7%
	Sanitize reconditioned water for contact use		(10%)	18%	8%
	Reuse rinse water		(10%)	25%	8%

[3] Response to the survey was low (six percent) which leads to the possibility of a self-selection bias. Also, a key survey question ("which efficiency measures have been implemented in the last three years?") would have excluded the plants that implemented measures subsequent or prior to the survey period.

	Membrane filtration of wastewater for reuse		(20%)	0%	20%
	Combined[3]				*22%*
Utilities/Boilers		25%			
Recycle steam condensate			(50%)	48%	34%
Combined		**100%**	**29%**		

[1] There were no reliable estimates available of amount of savings from the different technologies. This is our best guess based on information from similar technology in other sectors.
2 Pike 1997
[3] The first technology is complementary with the other technologies while the others are exclusive. Only some will be applicable at a given plant.

According to Yates (2002), penetration of the conventional technologies listed in the table above (except membrane filtration) is now as high as 90 percent. We performed a sensitivity analysis on the penetration rates to include this information and found that the overall savings vary between 9 and 35 percent using a reasonable range of penetration rates.

Estimate of Potential Water Savings

The conservation potential for common end uses was calculated in the end use studies (see Appendix C) and then applied to our GED-derived estimate of water use to get potential water savings for these end uses. We used data from Table F-12 above for the estimate of potential process water savings (Table F-13).

Table F-13
Potential Water Savings in the Preserved Fruit and Vegetable Industry (2000)

End Use	**Water Use (TAF)**	**Conservation Potential (percent)**			**Potential Savings (TAF)**		
		Low	**High**	**Best**	**Low**	**High**	**Best**
Process	50.8	9%	35%	25%	4.5	17.6	12.8

[1] Assumed range

Beverages (SIC code 208)

Industry Description

The Beverage industry includes establishments primarily engaged in manufacturing: malt beverages; malt; wines, brandy, and brandy spirits; distilled and blended liquors; bottled and canned soft drinks and carbonated waters; and flavoring extracts and syrups.[4] There are 609 establishments under SIC code 208 in California and of these, 391 are wineries, 69 are malt breweries, 87 manufacture soft drinks, and the rest make flavored syrups. Table F-15 shows total water coefficients and use. Figure F-4 shows water by end use.

Table F-15
Employment and Water Use in the Beverage Industry (2000)

Sub-industry	SIC code	Employment	GED[1,2]	Water Use (TAF)
Malt beverages	2082	5,030	6,756	23.5
Malt	2083	60	204	0.0
Wines, brandy, and brandy spirits	2084	20,210	1,211	16.9
Distilled and blended liquors	2085	490	329	0.1
Bottled and canned soft drinks	2086	10,070	1,990	13.8
Flavoring syrups	2087	1,940	1,705	2.3
Total Beverage Industry	**208**	**37,800**	**2,169**	**56.6**

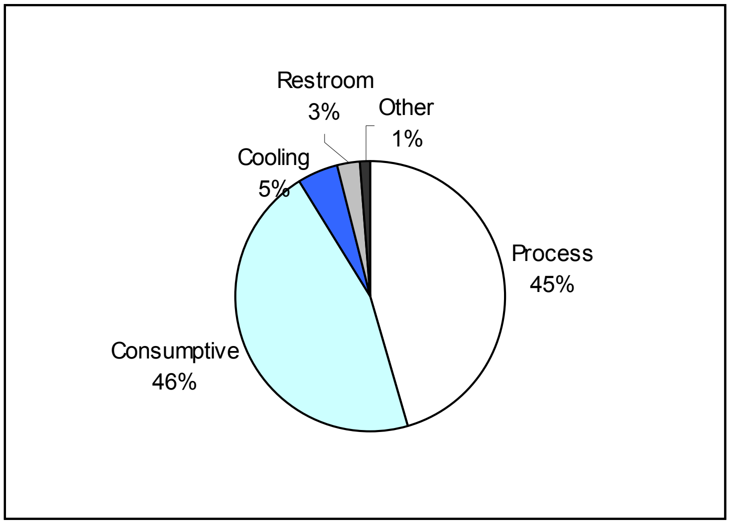
[1] Based on a 225-day year
[2] The GEDs estimated for 1995, were decreased by 6% to obtain the GED coefficients in 2000, for the industrial sector.

Water Use

The Beverage industry uses process water use for:
- The final product;
- Bottle washing;
- Refrigeration;
- Equipment cleaning and cleaning-in-place (C-I-P); and
- Boilers (for pasteurization and sterilization).

[4] This industry does not include fruit juices, which are classified under Fruit and Vegetable Processing (SIC code 203).

Figure 4
Water Use, by End Use, in the Beverage Industry



Source: Calculated from MWD audit of five beverage plants (MWD 2002).

Process water use includes consumptive use, i.e. water included in the final product. We assume that half of the process water use is incorporated into the final product.

Process Water Conservation Potential

A 1997 report by the California Institute of Food and Agriculture Research was the best and most recent indicator of penetration rates (Pike 1997). Although the survey is not a random sample, it offers the only available indicator of penetration rates (Table F-16).[5] The survey showed that wineries have implemented only some conservation measures.

Table F-16
Implementation of Process and Cooling Water Conservation Technologies in Wineries

Measure	**Percent Implementing Measure between 1994 and 1997**
Process Water	
Separate wastewater streams	37%
Self-closing nozzles	18%
Reuse non-contact cooling water	9%
Reduce wastewater to recapture product	9%
Sanitize reconditioned water for contact use	--
Reuse rinse water	18%
Cooling Water	
Eliminate single pass cooling	10%

[5] See footnote 4 above.

Source: Pike 1997

While most of the earlier efforts were focused on efficiency improvements, such as the introduction of self-closing nozzles and adjusting nozzle flow to their rated capacity, reusing rinse water is gaining more popularity. Discharges that can potentially be reused in the beverage industry include: final rinses from tank cleaning; keg washers; fermenters; bottle and can soak and rinse water; cooler flush water; filter backwash; and pasteurizer and sterilizer water. Areas of possible reuse are: first rinses in wash cycles; can shredder; bottle crusher; filter backflush; caustic dilution; boiler makeup; refrigeration equipment defrost; equipment cleaning; and floor and gutter wash.

Table F-17
Potential Process Water Savings in the Beverage Industry

Measure	**Savings[1]**	**Penetration Rate[2]**	**Potential[3]**
Self-closing nozzles	(30%)	25%	24%
Separate wastewater streams	(5%)	40%	3%
Reuse non-contact cooling water	(20%)	10%	18%
Reduce wastewater to recapture product	(20%)	10%	18%
Reuse rinse water	(20%)	20%	17%
Combined			**27%**

[1] There were no reliable estimates for this figures, these are simply our best guess
[2] These penetration rates are the same rates shown in Table F-16, adjusted upwards to account for some increased penetration from 1997 to 2000
[3] The first technology is complementary with the other technologies while the others are exclusive, only some will be applicable at a given plant.

By performing a sensitivity analysis on the penetration rates we found that the potential for saving process water varied between 19 and 31 percent.

Estimate of Potential Water Savings

The conservation potential for common end uses was calculated in the end use studies (see Appendix C) and then applied to our GED-derived estimate of water use to get potential water savings for these end uses. We used data from Table F-17 above for the estimate of potential process water savings.

Table F-18
Potential Water Savings in the Beverage Industry

End Use	**Water Use (TAF)**	**Conservation Potential (percent)**			**Potential Savings (TAF)**		
		Low	**High**	**Best**	**Low**	**High**	**Best**

[1] Assumed Range

Textile Industry (SIC code 22)

Industry Overview

The Textile industry is a relatively new industry in California. In the past three decades, the industry has grown into a $5 billion business located primarily in southern California. The industry is comprised of diverse, fragmented groups of establishments that receive and prepare fibers, transform the fibers into yarn, and then dye or finish the yarn into fabric. Table F-19 shows employment, water coefficients, and total use in the Textile sector.

Table F-19
Employment and Water Use in the Textile Industry (2000)

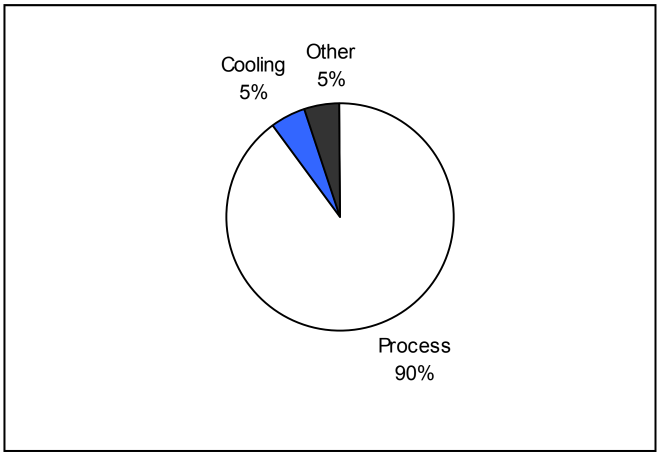
Sub-industry	**SIC code**	**Employment**	**GED[1,2]**	**Water Use (TAF)**
Broad, narrow, knit fabric mills	221, 224	3,180	299	0.7
Knitting mills	225	11,800	1,651	13.5
Textile finishing	226	4,020	910	2.5
Carpets	227	3,200	2,805	6.2
Yarn and thread	228	940	2,805	1.8
Misc. textile goods	229	4,060	2,328	6.5
	22	**27,200**	**1,660**	**31.2**

[1] Average across all regions, based on a 225-day year.
[2] The GEDs estimated for 1995, were decreased by 6% to obtain the GED coefficients in 2000, for the industrial sector.

Water Use

Due to data constraints, an end use breakdown for the textile industry was unavailable. Based on our study of end uses, we assumed that since reasonable restroom and kitchen use would not exceed 50 gallons per employee per day, at least 90 percent of the water use must be for process and cooling. Conversations with Textile industry experts indicated that the residual hot water from the cooling process is reused in various processes (usually dye baths) (Demanyovich 1990). We assumed that only five percent of overall water is used in cooling (Figure F-5).

Figure 5
Water Use, by End Use, in the Textile Industry



Source: Estimate based on interviews

The stages of textile manufacturing that use the most water are the "wet processing" steps, which involve transforming undyed, unprocessed fabric known as "greige" into the finished product through four broad stages:

- Fabric preparation (chemically treating the greige to remove impurities, improve strength and dye uptake, and enhance the appearance of the fabric);
- Dyeing;
- Printing; and
- Finishing.

In each stage, water is used to either make chemical baths or to wash out excess chemicals after processing. The amount of water used varies greatly among mills and depends on each mill's specific processing operations and equipment.

Table F-20
Water Use by Processing Category in the Textile Industry

Processing Category	Minimum (gal/lb)	Median (gal/lb)	Maximum (gal/lb)
Wool	13.3	34.1	78.9
Woven	0.6	13.6	60.9
Knit	2.4	10.0	45.2
Carpet	1.0	5.6	19.5
Stock/yarn	0.4	12.0	66.9
Non woven	0.3	4.8	9.9
Felted fabrics	4.0	25.5	111.8

Source: NCDENR 1998

Process Water Savings

Because of the high variability in water use, calculating detailed penetration rates and savings from individual technologies for this sector proved nearly impossible. Instead, we used the case study information provided below in Table F-21 to estimate penetration rates.

Table F-21
Process Water Savings in the Textile Industry

End Use	Type	Technology	Savings	Penetration
Preparation: scouring[1]	Reuse	Reuse of bleach, mercerizing[2] rinse water		
Preparation: desizing[3]	Reuse	Reuse of scouring, jet-weaving, bleach, mercerizing rinse water		
		Membrane filtration of desizing water[4]		Pilot stage
Continuous dyeing	Recycling	Countercurrent washing	20-50% of dyeing water use[5]	
	Efficiency	Use of automatic shutoff valves	20% of dyeing water use[6]	Probably high[7]
	Reuse	Reuse of rinse water from dyeing for dye bath makeup	50%[8]	Only 2 out of 60 firms as of 2002.[9]
VAT dyeing	Efficiency	Avoiding overflow rinsing	20-70% of dyeing water use[6]	
Carpet dyeing	Reclaimed water	Use of reclaimed water in carpet dyeing		Only 3-4 mills in CA in 2000[10]
Sanitation	Reuse	Reuse of colored wash water for cleaning floors and equipment in the print shop		

[1] Scouring: a cleaning process to remove impurities from fiber and yarn through washing with alkaline solutions.
[2] Mercerizing: chemical treatment of cotton and cotton/polyester fabrics to improve dye uptake and luster of the fabric.
[3] Desizing: sizing is the application of starches and materials, called sizes, to improve the quality of the fabric. Once sizing is completed, the fabric is desized, which involves treating the fabric with enzymes to breakdown the starches and then washed it.
[4] Ministry of Environment and Energy, Danish Environmental Protection Agency 2001
[5] Estimated from data presented in Asnes (1984).
[6] Estimated from data presented in NCDNRCD (2002).
[7] This technology has been around for a long time, but the textile industry is a relatively new industry in California (it emerged in the 1980s) so it is likely that most plants already have auto shut off valves in their continuous process lines.
[8] Estimated from conversation with Templeton (2002).
[9] Demanyovich 2002
[10] State Water Resources Control Board 2002

Using our best judgment of the penetration rates and the breakup of water use between the different sub-end uses, we estimated savings potential for each sub-end use (as shown in Table F-22).

Table F-22
Potential Process Water Savings in the Textile Industry (2000)

Process Sub-end Use	Measure	Portion of Process Use (percent)[1]	Savings (percent)	Penetration Rate (percent)	Savings Potential (percent)
Preparation	Reuse of scouring, bleach and mercerizing water	15%			33%
Dyeing	Reuse of rinse water from dyeing for dye bath make-up; use of reclaimed water in carpet dyeing; avoiding bath overflow	52%	50%[2] 100% 50%[3]	5%[4] 5%[5] 50%[6]	56%[7]
Printing		6%			10%[8]
Washing	Counter current washing, spray rinsing	27%	30%[3]	50%[6]	18%
Total Process		**100%**		**39%**	

[1] Estimated from flow rates provided in NCDENR et al. (1998).
[2] Estimated from conversation with Templeton (2002).
[3] Estimated from data in Table F-21 above.
[4] Estimated from conversation with Demanyovich (2002).
[5] Estimated from State Water Resources Control Board data (CSWRCB 2002).
[6] No data on penetration rates were available, 50 percent assumed.
[7] Carpet mills account for about 15 to 20 percent of the water use (we assumed reclaimed water applied). The other technologies were assumed to be applicable to all fabric and yarn mills.
[8] This is an assumption. Similar technologies such as reusing equipment wash water are possible at the printing stage.

We estimate that process water use savings range between 32 and 44 percent. Membrane filtration of the various waste streams could further increase the conservation potential.

Estimate of Potential Water Savings

We used data from Table F-22 above for the estimate of potential process water savings and we assumed that restroom water use comprised the majority of other use (see F-23 for total savings).

Table F-23
Potential Water Savings in the Textile Industry (2000)

End Use	Annual Use (TAF)	Conservation Potential (percent)			Potential Savings (TAF)		
		Low	High	Best	Low	High	Best
Process	21.8	32%	44%	39%	8.5	11.7	10.4
Cooling	6.2	9%	41%	26%	0.1	0.6	0.4
Other	3.1	49%	49%	49%	0.7	0.7	0.7
	31.2	**32%**	**45%**	**39%**	**9.4**	**13.1**	**11.5**

Crosscheck

NCDENR et al. (1998) estimated that "a reduction of 10-30 percent can be accomplished by taking fairly simple measures" like fixing leaks, turning off running hoses, and saving cooling water when the machinery is shut down. Dr. Robert

Demanyovich (2002) of RJD technologies, an expert in the textile industry, judged the overall savings to be somewhere between 20 to 50 percent.

Paper and Pulp (SIC codes 261,262, 263)

Paper and Pulp mills are very water-intensive facilities. Pulp facilities (SIC 261) convert wood products to pulp, which is then transported via pipe or truck to another manufacturing facility to be transformed into paper or paperboard. Integrated facilities produce pulp and paper in the same facility.[6] Table F-24 shows estimated California water use in this sector. Figure F-6 shows end use of water in pulp and paper mills from representative plants out of state. We assume comparable water uses here and urge state-specific data be collected.

Table F-24
Employment and Water Use in the Paper and Pulp Industry (2000)

Sub-industry	SIC code	GED[1,2]	Employees	Water Use (TAF)
Pulp Mills	261	12,590	370	3.2
Paper Mills	262	5,260	2,240	8.1
Paperboard Mills	263	10,320	1,500	10.2
Total			**4,110**	**22.0**

[1] Average across all regions and based on a 225-day year.
[2] The GEDs estimated for 1995, were decreased by 6% to obtain the GED coefficients in 2000, for the industrial sector.

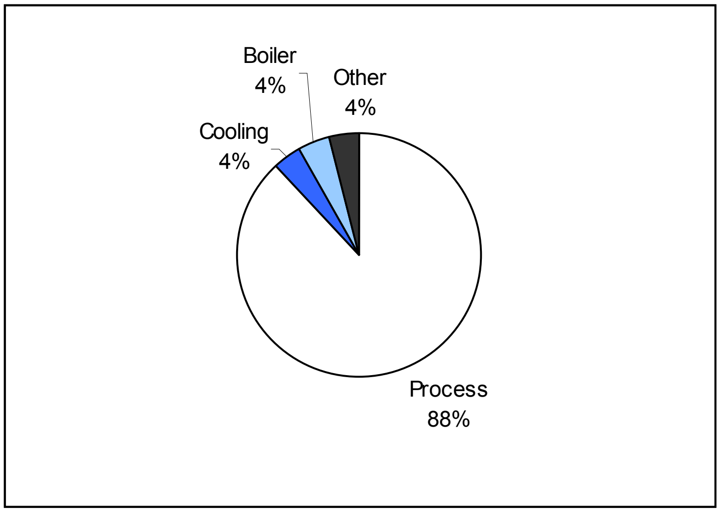
Water Use

The Paper and Pulp industry uses process water for the following purposes:

- **Pulping** – Digesting the raw material (wood) by chemical or mechanical means to release cellulose fibers by breaking the bonds that hold the fibers together;
- **Pulp Processing** – Removing impurities, preparing the fiber for manufacture of paper and bleaching the fiber to improve brightness; and
- **Paper/Paperboard Manufacturing** - Applying a watery suspension of cellulose fibers to a screen to drain the water and leave behind the fiber to form a sheet.

[6] Facilities that convert paperboard to boxes and cartons are also classified under SIC 26 but they are not included herein because they are significantly less water intensive.

Figure 6
Water Use, by End Use, in the Paper and Pulp Industry



Source: Texas Water Resources Control Board 1996

Process Water Savings

The average water use in the Paper and Pulp industry decreased from 15,000 gallons/ton of paper produced in the 1980s to about 2,500 gallons/ton today. Information about current conservation potential in this industry is relatively modest (see Table F-25).

Table F-25
Process Water Savings Paper and Pulp Plants

Technology	Process Water Saved (percent)	Penetration Information Available
Partial recycling of process water	20-40%	CDWR data (1995) indicate that between 40-50% of the plants surveyed practiced some kind of water recirculation.
Closed loop systems	80-90%	As far as we can determine, only one plant in 2000, Louisiana Pacific, had a closed-loop system, but there is an industry trend towards closed-loop systems.
Reclaimed water use	100%	The Pacific Crest Paper Mill in Southern California currently uses reclaimed water from the Irvine Ranch Water District for process water use.

This overall savings potential estimate was mostly based on the assumption that the Paper and Pulp industry can save considerable amounts of water by moving towards closed loop systems and increasing recycling of water. The development of new membrane filtration technologies is increasingly making this move a viable alternative. In the best case we assumed that a third of the plants will implement closed-loop systems and reduce water use by 70 percent. In the low conservation scenario, we assume that only 10 percent of the plants will be able to do so.

Estimate of Potential Water Savings

We used data from Table F-25 above for the estimate of potential process water savings (summarized in F-26).

Table F-26
Potential Water Savings in the Paper and Pulp Industry (2000)

	Water Use (TAF)	Conservation Potential (percent)			Potential Savings (TAF)		
End Use		**Low**	**High**	**Best**	**Low**	**High**	**Best**
Process	19.4	(16%)	(49%)	(34%)	3.1	9.5	6.6
Cooling	0.9	9%	41%	26%	0.1	0.4	0.2
Boiler	0.9	0%	10%	5%	0.0	0.1	0.0
Other	0.9	20%	40%	30%	0.2	0.4	0.3
	22.0	**(15%)**	**(47%)**	**(33%)**	**3.4**	**10.3**	**7.2**

Fabricated Metals (SIC code 34)

Industry Overview

The Fabricated Metals industry (SIC code 34) includes facilities that machine, clean, treat, coat, and paint metal parts. Machining operations involve using tools that travel on the surface of the metal to shear, etch, or cut it. Metal cleaning, a process found in virtually all fabricated metal industries, consists of chemically stripping the metal of old paint, oxidation, or plating. Water is used primarily for rinsing components after the various chemical processes and in preparing chemical baths.

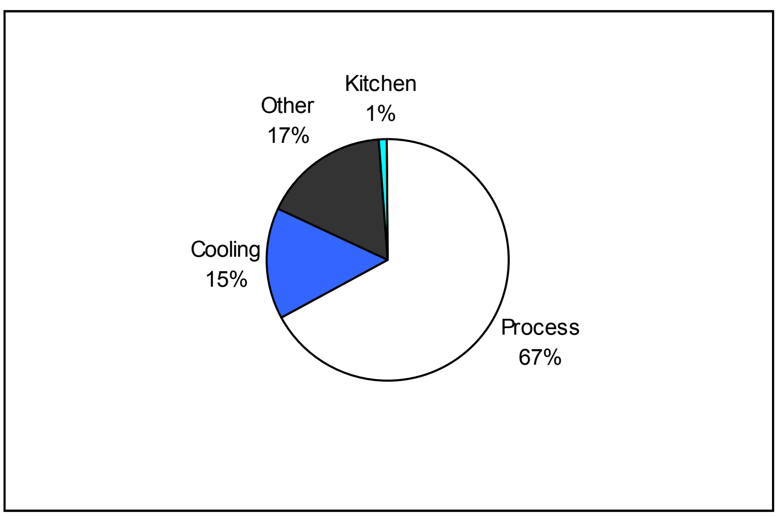
Individual facilities may perform one or more of these functions, either for third parties or as part of a larger manufacturing process. Southern California supports the largest Fabricated Metals industry in the United States due to the region's aircraft and electronics industries. Table F-27 shows total estimated water use in the Fabricated Metals sector of California in 2000. Figure F-7 shows water by end use in this sector; again, more extensive end use data should be collected.

Table F-27
Employment and Water Use in the Fabricated Metals Industry (2000)

Industry	SIC code	GED[1]	Employees	Water Use (TAF)
Fabricated Metals	34	215	132,600	19.7

[1] Average across all regions, based on a 225-day year.
[2] The GEDs estimated for 1995, were decreased by 6% to obtain the GED coefficients in 2000, for the industrial sector. See earlier information.

Figure F-7
Water Use, by End Use, in the Fabricated Metals Industry



Source: This was calculated from MWD audit data of an aircraft parts manufacturer (MWD 2002).

Process Water Savings

A 1994 survey of 318 metal finishers across the U.S. provided background information on the penetration of water conservation technologies (NCDENR et al., 1998). We applied the national averages found in these studies to California (Table F-28).[7]

Table F-28
Process Water Savings in the Fabricated Metals Industry

Measure	Process Water Savings (percent)	Penetration Rate in 1994 (percent) [1]
Flow restrictors	n/a	70%
Counter current rinsing	50-60%[2]	68%
Manually turn of rinse water when not in use	n/a	66%
Agitated rinse tanks	n/a	58%
Spray rinses	60%[3]	39%
Reactive or cascade rinses	50%[3]	24%
Conductivity controllers	40%[3]	16%
Flow-meters	n/a	12%
Timer rinse controls	40%[3]	11%
Acid recovery systems	50%[4]	(40%)
Best Estimate of overall process water savings		**33%[5]**

[1] NCDENR et al. (1998).
[2] Estimated from data provided by the City of San Jose, 1992 (b).
[3] Estimated from data provided by the US EPA 1994.
[4] A case study from the Office of Technical Assistance (OTA 2002) shows a savings of more than 90 percent of process water. We assume that an average of 50 percent can be saved and a penetration rate of 40 percent for this technology.
[5] To obtain the best estimate we assumed that spray rinses and cascade rinses were complementary technologies with about 50 percent market share each. We also assumed that acid recovery systems could be applied to 50 percent of the metal finishing facilities and that timer rinse controls and conductivity controllers can be implemented at all facilities.

Estimate of Potential Water Savings

The conservation potential for common end uses was calculated in the end use studies (see Appendix C) and then applied to our GED-derived estimate of water use to get potential water savings for these end uses. We used data from Table F-28 above for the estimate of potential process water savings (Table F-29).

[7] Detailed 2001 resource recovery information, by state, can be purchased from the National Metal Finishers Association, but the cost of the data exceeded our resources.

Table F-29
Potential Water Savings in the Fabricated Metals Industry (2000)

End Use	Water Use (TAF)	Conservation Potential (percent)			Potential Savings (TAF)		
		Low	High	Best	Low	High	Best
Process	13.2	25%	42%	33%	3.3	5.5	4.4
Cooling	3.0	9%	41%	26%	0.3	1.2	0.8
Other	3.3	43%	51%	50%	1.5	1.7	1.7
Kitchen	0.2	20%	20%	20%	0.0	0.0	0.0
Total	**19.7**	**26%**	**43%**	**35%**	**5.0**	**8.5**	**6.8**

Crosscheck

The Fabricated Metals industry has created a National Metal Finishing Strategic Goals Program, which aims to reduce water use by 50 percent compared to 1992 levels. The status for California in 2000 indicates that 65 percent of the goal has been met for water efficiency (National Metal Finishing Strategic Goals Program 2000). These findings imply about a 25-percent reduction in current water use is possible.

High Tech Industry (SIC codes 357, 36, 38)

Industry Overview

There is no standard definition of the High Tech industry. In this report, we adopted the definition used by the Portland Water Bureau (Boyko et al. 2000) and included the following sub-industries: computers and office equipment (SIC code 57); electronic equipment and components (except computer equipment) (SIC code 36); and measuring, analyzing, and controlling instruments (SIC code 38). Table F-30 lists total employment and estimated water use in the High Tech industry in 2000.

Table F-30
Employment and Water Use in the High Tech Industry (2000)

Sub-industry	SIC code	GED[1]	Employees	Water Use (TAF)
Semiconductor devices	3674	356	61,540	15.1
PCB manufacture and assembly	3672, 3679	405	77,790	21.8
Computer and office equipment	357	88	95,000	5.8
Rest of high tech	Rest of 36,38	156	300,592	32.4
Total High Tech	**357,36,38**	**203**	**534,930**	**75.0**

[1] Based on a 225-day year
[2] The GEDs estimated for 1995, were decreased by 6% to obtain the GED coefficients in 2000, for the industrial sector. See earlier discussion.

Semiconductor devices (SIC code 3674) and printed circuit board manufacturing and assembly (SIC codes 3672 and 3679) use about half of the water used in the High Tech industry. Semiconductor manufacturing consists of growing silicon crystals and then cutting and polishing them into thin silicon wafers. Hundreds of integrated circuits are then etched onto the wafer in an ultra-clean environment. A printed wiring board (PWB) or printed circuit board (PCB) is a device that provides electrical interconnections and a surface for mounting electrical components. The production process consists of etching patterns of conductive material, usually copper, onto a non-conductive base. After each step of surface preparation, electroplating, pattern masking, and etching, water is used for rinsing. The rest of the High Tech industry includes facilities that manufacture and assemble various electrical, electronic, and communication components.

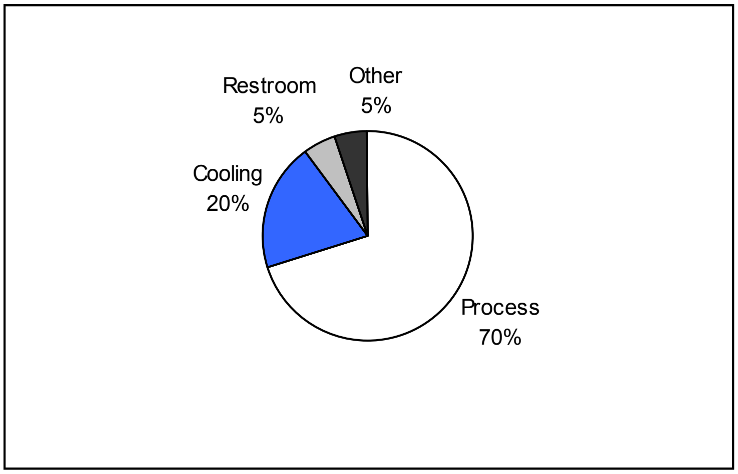
Water Use

Process water use comprises most of the High Tech industry's water use (60 to 80 percent), cooling uses 20 to 30 percent, and the rest is domestic and irrigation use (Figure F-8). Process water is used for:

- Passing potable city water through a reverse osmosis membrane to remove impurities, producing ultra-purified water (UPW)[8];
- Rinsing and tool cleaning (water of an extremely high purity is used to rinse components after they are treated with solvents and acids); and
- Scrubbing (water is used to remove polluting gases from exhaust air).

[8] Typically, 1,400 to 1,600 gallons of potable water produce 1,000 gallons of UPW.

Figure F-8
Water Use, by End Use, in the High Tech Industry



Source: City of San Jose 1992 (h)

Process Water Savings

In 1994, SEMATECH, a semiconductor industry association, conducted an assessment of the status of water conservation in the semiconductor industry, determined future requirements, and established standard terminology and metrics to characterize water consumption in the industry. This study was the best source of penetration rate information available.

Table F-31
Process Water Savings in the Semiconductor Industry

End Use	Process Water Saved (percent)[1]	Penetration Rate (percent)[1]	Penetration Data Year
Improve efficiency by modifying rinse tools	5-10%	80%	1994
Cascade rinsing/ spray rinses	Up to 60%[2]	50%[3]	
Rinse optimization	25-50%[4,5]	40%[5]	2000
Recycle UPW by selecting cleanest rinse streams	50%[6]	39%	1994
Reuse rinse effluent in wet scrubbers	5%[7]	70%	1994
Improve efficiency of UPW production unit	5-15%	20-30%	
Best Estimate of Overall Conservation Potential			**40-70%**

[1] Unless otherwise indicated, all water savings and penetration information were obtained from SEMATECH (1994).
[2] City of San Jose 1992(h)
[3] The SEMATECH (1994) survey reveals that about 50 percent of the facilities use wet decks with dump rinsers with the remaining evenly split between cascade rinsers and spray rinsers.
[4] Chiarello (2000) estimates savings of 25 to 80 percent in process water use using rinse optimization.
[5] Based on our conversation with Rosenblum (2002), typical savings appeared to be around 25 percent while the penetration rate was about 40 percent.
[6] The survey estimates that about half the facilities recycling water recover 70 percent of the UPW consumed and half recover about 30 percent. Topical Reports (2000) estimates UPW recovery at 40 to 50 percent.

[7] Scrubbers consume about 5 to 10 percent of process water in semiconductor fabrication. The SEMATECH (1994) survey also indicated that almost 70 percent of facilities surveyed reused wafer rinse water in cooling towers and scrubbers, replacing almost all the fresh water use in these applications.

The semiconductor industry has been a pioneer in water conservation and many technologies developed for this industry have been adopted by other High Tech industries. Indeed, recent studies indicate that comparable opportunities exist for the application of semiconductor industry water conservation technologies, such as rinse optimization, reuse of reverse osmosis backwash, and recycling UPW rinse water, to the Printing Wiring Board and Computer Components industries, yielding savings of 40 to 50 percent. Because data on conservation potential were not available for the other High Tech sub-industries, we assumed that the process water savings and penetration rates estimated for the semiconductor industry are applicable to the entire industry.

By varying the penetration rates from Table F-31 above, we obtained a range of 29 to 53 percent possible savings in process water Table F-32).[9]

Table F-32
Potential Process Water Savings in the High Tech Industry (2000)

Sub-end Use[1]	Portion of Process Use (percent)	Measure	Savings from Measure[2]	Best Est. Penetration Rates[3]	Potential Savings
Rinsing	80%	Improve efficiency by modifying rinse tools	10%	90%	1%
		Cascade rinsing/spray rinses	50%	60%	29%
		Rinse optimization	40%	50%	25%
		Recycle UPW by selecting cleanest rinse streams	50%	50%	33%
		Reuse rinse effluent in wet scrubbers	5%	80%	1%
Scrubbers	10%	Reuse rinse effluent in wet scrubbers	5%	80%	1%
UPW Production	10%	Improve efficiency of UPW production unit	10%	40%	6%
Total Conservation Potential[4]			**43%**		

[1] This break-up of sub-end uses is our best guess.
[2] See Table F-29 above for the ranges and sources from which these percentages were taken.
[3] SEMATECH 1994. Because the SEMATECH study is from 1994 and the High Tech industry adopts new technologies quickly, we increased the penetration rates slightly.
[4] In estimating the total conservation potential, rinse optimization is considered to be the same as recycling, since it involves recycling of selected rinses. The rinsing measures are assumed to be complementary, i.e. they can all be simultaneously applied.

[9] If dry cleaning technologies become feasible in the future, then reductions in water needs by as much as 50-80 percent of current use are possible. A high estimate of technical potential is based on the assumption that dry cleaning techniques become technically feasible in the next few years.

Estimate of Potential Water Savings

The conservation potential for common end uses was calculated in the end use studies (see Appendix C) and then applied to our GED-derived estimate of water use to get potential water savings for these end uses. We used data from Table F-32 above for the estimate of potential process water savings (Table F-33).

Table F-33
Potential Water Savings in the High Tech Industry (2000)

End Use	Water Use	Conservation Potential (percent)			Conservation Potential (TAF)		
	(TAF)	Low	High	Best	Low	High	Best
Process	52.5	29%	53%	43%	15.2	27.8	22.6
Cooling	15.0	9%	41%	26%	1.4	6.2	3.9
Restroom	3.8	49%	49%	49%	1.8	1.8	1.8
Other	3.8	0%	25%	10%	0.0	0.9	0.4
Total	**75.0**	**25%**	**49%**	**38%**	**18.6**	**36.6**	**28.7**

Crosscheck

The literature expects the semiconductor industry to significantly decrease water use over the next decade. Specifically, producing an 8-inch wafer disc, which used about 30 gal/in^2 in 1997, was expected to use 10 gal/in^2 in 2000 and 6 gal/in^2 by the end of 2003 (Allen and Hahn 1999, NRTS 2001, and SEMATECH 1994).[10] This expectation indicates that the savings of 37 percent that we have indicated are feasible. However, it is important to keep in mind that the benchmarks set by the NTRS are goals for the industry to strive to achieve, and not necessarily technically achievable at the current time.

Boyko et al (2000) estimate the overall savings to be much lower (about six percent), although specific case studies mentioned in the study achieved savings of 17 percent. Their estimates, however, include only simple low cost measures and exclude savings from rinse optimizations and recycling of UPW rinses.

[10] In the semiconductor industry, gallons per square inch (g/in^2) appears to be a standard metric of measuring water use. Typically wafer disc sizes are 8-inch/200mm for older versions or 12-inch/300mm for newer versions.

Petroleum Refining (SIC code 291)

Industry Description

SIC code 291 includes establishments primarily engaged in producing gasoline, kerosene, distillate fuel oils, residual fuel oils, and lubricants, through fractionation or straight distillation of crude oil, redistillation of unfinished petroleum derivatives, cracking, or other processes.

In 2000, there were 22 operational refineries in California (Petroleum Supply Annual 2000) employing about 9,900 people. Data from 13 of these facilities were included in the 1995 CDWR survey (Table F-34).

Table F-34
Employment and Water Use in the Petroleum Refining Industry (2000)

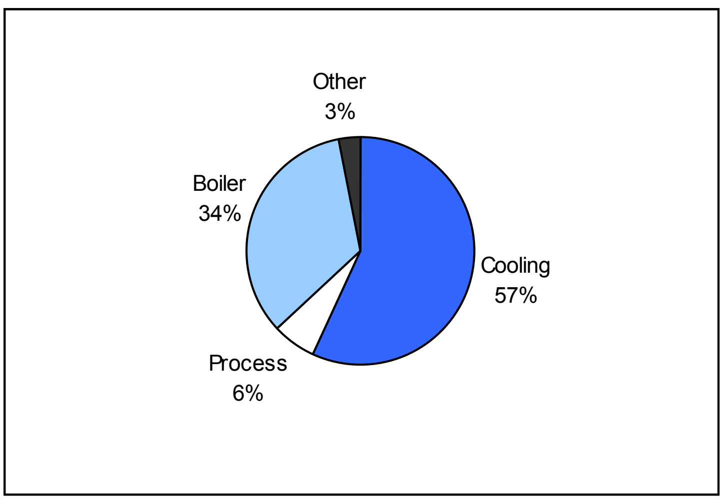
Industry	SIC code	GED	Employees	Water Use (TAF)
Petroleum Refining	291	14,676	9,890	84.1*

* Excludes 11.1 TAF of reclaimed water

Water Use

Refineries use water primarily in high and low-pressure boilers to produce steam and in cooling towers. Overall, water use in this industry has decreased considerably since the 1995 CDWR survey and six refining facilities from the survey are no longer operational.[11]

Figure F-9
Water Use, by End Use, in the Petroleum and Coal Industry



Source: AWWA Annual Conference Proceedings 1996

Process Water Savings

Recent water conservation efforts in the refining industry have focused on:

- Optimization using software algorithms;

[11] This finding is consistent with a national trend of moving refineries overseas.

- Reusing of secondary effluent; and
- Replacing freshwater for cooling tower makeup and boilers with treated reclaimed water.

The first two measures have typically reduced water use by 5 to 12 percent (estimated from Wilbur et al. 2002) but the primary trend for water conservation likely involves increasing the use of reclaimed water.

Of the 22 operational facilities in 2000, four facilities (the ARCO facility in Carson, the two Chevron facilities - El Segundo and Richmond, and the Exxon-Mobil facility in Torrance) use some reclaimed water for cooling. The Exxon Mobil facility also uses reclaimed water for boiler use and, consequently, has cut its freshwater use by 98 percent (Schaich 2001). The others have reduced water use by an estimated 40 to 60 percent (based on how much water was replaced by reclaimed water)

The refining sector is increasingly open to the idea of using highly treated reclaimed water in their cooling towers because of the added benefit of improved reliability of supply (and hence operations) during droughts. It is also a cost-effective option for both the refineries and local water agencies.

No industry-wide surveys of water use in this industry are available. While refineries could technically replace all cooling, process, and boiler water with reclaimed water, we assume a more realistic replacement estimate of 85 percent of cooling and boiler water and a penetration rate of 20 percent in 2000 (4 out of 22 refineries).

Estimate of Potential Water Savings

Table F-35
Potential Water Savings in the Petroleum and Coal Industry

End Use	Water Use (TAF)	Conservation Potential (percent)			Savings Potential (TAF)		
		Low	High	Best	Low	High	Best
Cooling	48.0	50%	100%	80%	24.0	48.0	38.4
Process	5.0	0%	0%	0%	0.0	0.0	0.0
Boiler	28.6	50%	100%	80%	14.3	28.6	22.9
Other	2.5	20%	50%	40%	0.5	1.3	1.0
Total	**84.1**	**46%**	**93%**	**74%**	**38.8**	**77.9**	**62.3**

Crosscheck

Water use in the refining sector varies considerably from 20 to 60 gallons/barrel of oil. This range probably indicates the potential magnitude for efficiency improvements.

1 Introduction

This Water Supply Assessment (WSA) has been prepared to assist the City of Menlo Park (City) and the California Water Service Company (Cal Water) in satisfying the requirements of Water Code Section 10910 et. seq. - Water Supply Planning to Support Existing & Future Uses.

The Menlo Park Municipal Water District (MPMWD) and California Water Service Company (Cal Water) are water suppliers for portions of the City of Menlo Park (City). The City is preparing an update to its Housing Element and is the lead agency under the California Environmental Quality Act (CEQA). Both CEQA and the California Water Code require a lead agency to consider water supply and demand as part of the development review process.

1.1 Requirements for a WSA

The requirement to prepare a WSA was established in 2002 by Senate Bill (SB) 610, which emphasizes the interrelationships between land use and water supply planning, and requires the incorporation of water supply and demand analysis at the earliest possible stage in the land use planning process. The stated intent of SB 610 is to strengthen the process by which local agencies determine the adequacy and sufficiency of current and future water supplies to meet current and future demands.

SB 610 amended the California Public Resources Code to incorporate Water Code findings within the CEQA process for certain types of projects. SB 610 added Water Code Sections 10910, 10911, 10912, 10913, and 10915 (Water Supply Planning to Support Existing and Planned Future Uses), which describe when a WSA needs to be prepared and the required elements of that WSA. The WSA is then used as an informational document to support the CEQA process. SB 610 also amended Water Code Section 10631 (the Urban Water Management Planning Act) to create a clear relationship between an agency's Urban Water Management Plan (UWMP) and subsequent WSAs and to allow the UWMP to serve as a foundational document for the analysis in the WSA.

Water Code Section 10910 et. seq. defines the "projects" that require a WSA and the lead agency's responsibilities related to the WSA. A WSA is required for:

- A proposed residential development of more than 500 dwelling units;
- A proposed shopping center or business establishment employing more than 1,000 persons or having more than 500,000 square feet of floor space;
- A proposed commercial office building employing more than 1,000 persons or having more than 250,000 square feet of floor space;
- A proposed hotel or motel, or both, having more than 500 rooms;
- A proposed industrial, manufacturing, or processing plant, or industrial park planned to house more than 1,000 persons, occupying more than 40 acres of land, or having more than 650,000 square feet of floor area;

- A mixed-use development that includes one or more of the uses described above;
- A development that would demand an amount of water equivalent to or greater than the amount of water required by a 500-dwelling-unit project; and
- For lead agencies with fewer than 5,000 water service connections, any new development that will increase the number of water service connections in the service area by ten percent or more.

A WSA must provide:

- a description of all relevant water supply entitlements, water rights, and/or water contracts;
- a description of the available water supplies, in normal, dry and multiple dry years, and the infrastructure, either existing or proposed, to deliver the water; and
- an analysis of the demand placed on those supplies, by the project, and relevant existing and planned future uses in the area for at least a 20-year period.

The lead agency may incorporate the water suppliers' UWMP by reference, if the supplier included the proposed development's demands in the UWMP.

While water supply is clearly an important consideration in approval of a development, nothing in SB 610 prevents a lead agency from approving a proposed project even in the face of information concluding that there is not sufficient water supply for build-out of the project. However, where the description of existing water supply entitlements, water rights, and/or water contracts shows insufficient water supplies to serve the proposed project, as well as existing and planned uses over the 20-year planning horizon, additional information is required to describe how and where sufficient supplies may be obtained. Such information must include the estimated costs, financing methods, and regulatory approvals needed to obtain new supplies, as well as a projected time frame for obtaining them.

1.2 Summary of the Project

This WSA considers the proposed Housing Element Update for the City (Project). The Project involves the accommodation of up to 1,318 new dwelling units within the City by 2035. The City plans to accommodate these new units by:

- Amending its Zoning Ordinance to accommodate up to 900 housing units on 14 sites throughout the City;
- Implementing programs to accommodate 118 infill units in the downtown area; and
- Implementing programs to allow for the development of up to 300 second units on existing single family residential parcels.

Figure 1.1 illustrates the location of the 14 sites proposed for rezoning.

FIGURE 1.1
HOUSING ELEMENT LOCATION MAP

The Project includes sites within both the MPMWD service area and Cal Water service area. Two of the proposed rezoning sites, Hamilton Avenue East and Haven Avenue, are anticipated to be redeveloped by 2015. The remaining growth will be accommodated over the build out period. Table 1.1 outlines the sites under consideration, the water service area in which the sites are located, the current land use at the site, the maximum number of units proposed at each site, and the year in which completion is anticipated. Table 1.1 illustrates that more than the potential 900 units have been identified on the 10 rezoning sites located in the MPMWD service area. Because the City is proposing to limit the total number of units on the rezoned sites to 900 units, City policy will limit the total number of new units in the MPMWD service area associated with the Project.

Table 1.1 – Proposed Housing Units Resulting from Implementation of the Proposed Housing Element Update

Site Number	Site Name	Water Service Area	Existing Use	Number of New Units Proposed	Year of Completion
2	Hewlett Foundation	Cal Water	Vacant	98	2035
4	401-445 Burgess Dr	Cal Water	Office: Multi-Story	16	2035
5	8 Homewood Pl	Cal Water	Office: Single Story	25	2035
13	Main Post Office	Cal Water	Post Office Slated for Closure	76	2035
NA	Downtown Infill	Cal Water	Single/Multifamily Residential	118	2035
NA	West Menlo 2nd Units	Cal Water	Single Family Residential	40	2035
Total Units with Identified Sites in Cal Water Service Area				**373**	
NA	Additional 2nd Units	Cal Water	Single Family Residential	145	2035
Total Units Proposed in Cal Water Service Area				**518**	
1	I-280 and Sand Hill (Banana Site)	Menlo Park	Vacant	52	2035
3	Corpus Christi	Menlo Park	Vacant	30	2035
6	St. Patrick's Seminary	Menlo Park	Vacant	25	2035
7	125-135 Willow Rd	Menlo Park	Office: Multi-Story	10	2035
8	555 Willow	Menlo Park	Restaurant	8	2035
9	Veterans Affairs Clinic	Menlo Park	Vacant	60	2035
10	MidPen's Gateway Apts	Menlo Park	Multifamily Residential	42	2035
11	MidPen's Gateway Apts	Menlo Park	Multifamily Residential	36	2035
12	Hamilton Ave East	Menlo Park	Light Industrial and Vacant	216	2015
14	Haven Ave	Menlo Park	Light Manufacturing, Storage, and Vacant	464	2015
Total Units with Identified Sites in MPMWD Service Area				**943**	
NA	Additional 2nd Units	Menlo Park	Single Family Residential	115	2035
Total Units Proposed in MPMWD Service Area				**1058**	

The City estimates that each new unit will house 2.55 persons on average and the population increase associated with the project is 3,361 persons.

1.3 Scope of Analysis

This WSA describes the relationship between the future demands associated with the Project in both MPMWD's and Cal Water's service areas and the availability of water supply under different climatic conditions. This WSA has been prepared to assist the City in evaluating the impacts of the Project on the water supply.

Specifically, this WSA:

- Provides information on MPMWD's and Cal Water's water supply that is consistent with Water Code Sections 10620 et. seq. (the Urban Water Management Act) and 10910 et. seq. (Water Supply Planning to Support Existing and Planned Future Uses);
- Provides information on current water demands and projected water demands based on the City's Housing Element Update and the water demands associated with the proposed units in the Update; and
- Compares water supplies and water demands for the normal, single dry and multiple dry years.

1.3.1 Urban Water Management Plans

MPMWD adopted its "2010 UWMP" on June 14, 2011. The UWMP, which is incorporated by reference, can be found at http://www.menlopark.org/departments/pwk/MP_2010_UWMP_Final.pdf.

Cal Water adopted its "2010 UWMP" for the Bear Gulch district on June 24, 2011. The UWMP, which is incorporated by reference, can be found at (https://www.calwater.com/your_district/uwmp/bg/2010_Urban_Water_Management_Plan_(BG).pdf)

Each UWMP conforms to the requirements of the Urban Water Management Planning Act and includes:

- A description of the water service area including climate, current and projected population and other demographic factors that affect water management planning;
- A description and quantification of the existing and planned water sources;
- A description of the reliability and vulnerability of the water supply to seasonal or climatic shortages in the average water year, single dry water year and multiple dry water year;
- Contingency plans including demand management and conjunctive use potential;
- A description of current and projected water demands among all user classes in 5-year increments;
- A description of all water supply projects and water supply programs that may be undertaken by MPMWD, Cal Water, their wholesale supplier the San Francisco Public Utilities Commission (SFPUC) and their regional representative, the Bay Area Water Supply and Conservation Agency (BAWSCA).

In order to comply with the requirements of the Water Conservation Act of 2009 (SBx7-7) both UWMPs include a "baseline" water use and water use targets for 2015 and 2020. These targets, which are expressed as water use in gallons per capita per day (gpcd) will be used to validate each water suppliers' compliance with SBx7-7 requirements to reduce water use by 20 percent from the baseline by 2020.

The targets, which are discussed in detail in Chapter 4 of this WSA, effectively serve to cap future demands.

1.3.2 Previous Water Supply Assessments

Three previous WSAs have been prepared for the MPMWD and Cal Water Service Areas.

The Menlo Gateway WSA was prepared to support a 2009 Environmental Impact Report (EIR) for a 15.9 acre mixed used project in the MPMWD service area. This WSA predated MPMWD's 2010 UWMP and the demands documented in the Menlo Gateway WSA were included in MPMWD's 2010 UWMP.

The Water Supply Assessment for the El Camino Real/Downtown Specific Plan Project was prepared in April 2011 to support an EIR for a specific plan covering approximately 130 acres in the City's downtown core in the Cal Water service area. This WSA predated Cal Water's 2010 UWMP and the demands documented in the El Camino Real/Downtown Specific Plan were included in Cal Water's 2010 UWMP.

The Water Supply Assessment for the Menlo Park Facebook Campus Project was completed in November 2011 to support an EIR for the redevelopment of two sites, totaling 79 acres, for a corporate campus in the MPMPW service area. This WSA was developed after the completion of MPMWD's 2010 UWMP but it concluded that the planned demands were consistent with and included in the non-residential demand allowance projected in the 2010 UWMP.

1.4 Structure of this Report

This report is structured to facilitate the presentation of information required by the Water Code and to outline the analysis necessary to evaluate the sufficiency of water supply to meet planned growth.

Table 1.2 – Index of SB 610 Requirements

Required Element	Location in Documents
Description of Service Area	Section 2.1
Population Projections in 5-year Increaments	Table 2.1
Description and Quantification of Water Supplies	Section 3.1 and 3.2
Description of Supply Reliability to Climate Conditions	Section 3.1 and 3.2
Description of Contingency Plans	*
Description of Demand Management Potential	Section 4.5
Projection of Water Demands in 5-year Increments	Tables 4.3, 4.5, and 5.1-5.6
Description of Projects & Programs Undertaken to Meet Demands	Section 5.2
Description of Demand Management Measures Employed	*
Determination of Supply Sufficiency under Normal, Single & Multiple Dry Years	Section 5.1
Identification of Water Supply Entitlements & Rights and water received under rights	Section 3.0
Information related to capital outlay programs for financing delivery of water supply	Section 5.2
Information on permits needed and regulatory requirements associated with water supply	Section 5.3
* Demand Managment and Contingency Planning discussion incorporates the MPMWD and Cal Water 2010 Urban Water Management Plans as allowed by SB 610	

2 Water Service Area

The City is located in the San Francisco Bay Area, in San Mateo County, approximately halfway between San Francisco and San Jose. The city is bordered by Atherton and Redwood City to the north, East Palo Alto to the east, Woodside to the west and Palo Alto and Portola Valley to the south. The city covers approximately 18 square miles, of which approximately 12 square miles consist of San Francisco Bay and wetlands. The City reports its 2012 population as 32,513 people. There are 12,388 households in Menlo Park, with an average household size of 2.55 people.[1]

The City is served by two primary water purveyors, MPMWD and Cal Water. Figure 2.1 illustrates the service area of each utility.

MPMWD's service area includes approximately 40 percent of the City's population and is divided into four zones:

- The Lower Zone is located north and east of El Camino Real and serves primarily residential and small commercial land uses. The zone includes the Belle Haven, Bay Road, and Willows neighborhoods.
- The High Pressure Zone is located in northern Menlo Park between Highway 101 and the Bayfront Expressway and serves primarily industrial land uses. It includes the Bohannon Industrial Park and Tyco Properties. The high pressure zone is hydraulically disconnected from the other zones with inter-tie capabilities.
- The Upper Pressure Zone is located in western Menlo Park and is geographically and hydraulically disconnected from other zones. It serves primarily the residential Sharon Heights neighborhood, the Sharon Heights Golf Course and the SLAC National Accelerator Lab.
- The Business Park Zone is located along O'Brien Drive between Willow Road and University Avenue. It serves primarily light industrial land uses.

The Cal Water service area includes the remaining portion of the City of Menlo Park as well as the communities of Atherton, Portola Valley, Woodside, and adjacent unincorporated portions of San Mateo County.

FIGURE 2.1
WATER DISTRICT MAP

2.1 Population

The City is essentially built-out and future population growth is assumed to be associated with redevelopment projects within the existing urban footprint, such as those anticipated by the Project. The United States Census has reported the City's 2000 population as 30,781 persons and its 2010 population as 32,077 persons. As noted above, the City reports its 2012 population at 32,513 persons.

2.1.1 Comparison to 2010 UWMPS

The City's population is covered in two 2010 UWMPs:

- MPMWD's UWMP, which covers a portion of the City, and
- Cal Water's UWMP which covers its Bear Gulch District, a service area much larger than the City.

In its 2010 UWMP, MPMWD estimated its 2010 service population was 14,198 (about 40 percent of the total City population). This population figure was used to establish MPMWD's water use targets. Total projected water demand was calculated based on projections of both residential and non-residential growth. MPMWD's demand projections assumed a very modest residential growth rate of 0.42 percent annually and a strong growth in the Commercial-Industrial-Institutional (CII) sectors. The 2010 UWMP explicitly included estimates for near term, largely commercial, development projects including:

- Menlo Gateway (the Bohannon Project) for which the City has an approved WSA;
- GM Site – Sun and Facebook Project for which the City has an approved WSA;
- Business Park, which is included within the general non-residential growth analysis; and
- Hamilton Avenue East, which is included within the general residential growth allowance and which is one of the fourteen developments that are the subject of this WSA.

The remaining residential growth contemplated by the Project, was not specifically planned for in MPMWD's 2010 UWMP.

Because Cal Water's service area is much larger than the City, it is difficult to directly correlate Cal Water's population projections to the planned City growth. In its 2010 UWMP, Cal Water projected that population in its service area would grow from 57,254 persons in 2010 to 64,573 in 2035. This is an annual growth rate of 0.51 percent per year, which is higher than the growth rate used in the City's UWMP. While Cal Water did not specifically delineate planned projects within its UWMP growth projections, it did acknowledge that growth in the Menlo Park portion of its service area was expected to consist of redevelopment to multifamily uses. This is consistent with the Water Supply Assessment for the City's El Camino Real /Downtown Specific Plan, which was prepared concurrently with the Cal Water UWMP.[2]

---

[2] California Water Service Company, 2010 Urban Water Management Plan Bear Gulch District, June 2011

2.1.2 Population Used in the this WSA

Because of the different service area limits, the UWMPs do not provide for straight forward projection of the City's projected population. However, other City and regional planning documents do provide projections about planned growth in the City as a whole. Table 2.1 illustrates population projections for the City's service area based on projections from the Association of Bay Area Governments (ABAG).

Table 2.1 – City Population: Current and Projected

Population – Current and Projected							
	2010	**2015**	**2020**	**2025**	**2030**	**2035**	**Data Source**
City Limits	31,700	33,434	34,600	35,900	37,200	38,500	*Association of Bay Area Governments 2009*
Note: 2015 Projections assume the completion of the proposed Hamilton & Haven Projects							

These projections equate to an annual growth rate of 0.8 percent, which is higher than the projections in either MPMWD's or Cal Water's UWMP. This likely reflects the fact that at least some of the growth anticipated by ABAG and the Housing Element Update was not included in the UWMP projections.

2.2 Climate

The project area has a Mediterranean climate characterized by cool, wet winters and warm, dry summers. Rainfall averages 15.2 inches per year (measured at Palo Alto) and is generally concentrated in the wet season from late October to early May. Cal Water's Bear Gulch UWMP notes that average rainfall of 29.5 inches is measured at Woodside, illustrating the range of rainfall across that service area. Table 2.2 presents the base climate data for the City, which is brought forward from MPMWD UWMP.

TABLE 2.2 – CLIMATE

	Standard average ETo*, in	Average rainfall, in	Average temperature, °F
January	1.48	3.23	48.1
February	1.88	2.88	51.3
March	3.35	2.22	53.7
April	4.74	0.99	56.6

* ETo, or evapotranspiration, is the loss of water from evaporation and transpiration from plants.			
Rain and temperature values from Palo Alto CA NOAA Station #046646 over 1951 to 2004			
Evapotranspriation values are from Union City CIMIS station # 171			

3 Water Supply

This section provides an overview of the water supplies for MPMWD and Cal Water. The City and County of San Francisco's Regional Water System (RWS), operated by the San Francisco Public Utilities Commission (SFPUC), is the major water supply source for both the MPMWD and Cal Water's Bear Gulch District. The RWS supplies twenty-six wholesale customers as well as the City and County of San Francisco. The "Water Supply Agreement between the City and County of San Francisco and Wholesale Customers in Alameda County, San Mateo County and Santa Clara County" (July 2009, hereinafter "2009 Water Supply Agreement") governs this relationship. The most recent supply allocation document developed under the 2009 Water Supply Agreement is included in Appendix A.

Cal Water's Bear Gulch District also sources surface water from within its watershed, while MPMWD is actively working to develop a groundwater supply that will add emergency reliability to its overall supply portfolio. Tables 3.1 and 3.2 provide a summary of existing and planned water supply sources in acre-feet per year (AFY), as outlined in the UWMPs for MPMWD and Cal Water. Each supply is discussed in detail below.

Table 3.1 – MPMWD Existing and Planned Sources of Water in AYF

Wholesale Sources	Contracted Volume	2015	2020	2025	2030	2035
San Francisco Public Utilities Commission*	4,993.0	4,993.0	4,993.0	4,993.0	4,993.0	4,993.0

3.1 San Francisco Public Utilities Commission Regional System

The SFPUC Regional Water Supply (RWS) is predominantly from the Sierra Nevada, delivered through the Hetch Hetchy aqueducts, but also includes treated water produced by the SFPUC from its local watersheds and facilities in Alameda and San Mateo Counties. The amount of imported water available to the SFPUC's retail and wholesale customers is constrained by hydrology, physical facilities, and the institutional parameters that allocate the water supply of the Tuolumne River. Due to these constraints, the SFPUC is very dependent on reservoir storage to firm-up its water supplies.

The SFPUC serves its retail and wholesale water demands with an integrated operation of local Bay Area water production and imported water from Hetch Hetchy. In practice, the local watershed facilities are operated to capture local runoff.

3.1.1 Water System Improvement Plan

In order to enhance the ability of the SFPUC water supply system to meet identified service goals for water quality, seismic reliability, delivery reliability, and water supply, the SFPUC has undertaken the Water System Improvement Program (WSIP), approved October 31, 2008. The WSIP will deliver capital improvements aimed at enhancing the SFPUC's ability to meet its water service mission of providing high quality water to customers in a reliable, affordable and environmentally sustainable manner. The WSIP includes a total delivery reliability goal of 265 MGD of supply with no greater than 20 percent rationing in any one year of a drought.

In approving the WSIP, SFPUC's five-member governing commission (Commission) adopted a Phased WSIP Variant for water supply that was analyzed in its CEQA document. This Phased WSIP Variant established a mid-term water supply planning milestone of 2018 when the Commission is scheduled to reevaluate water demands through 2030. At the same meeting, the Commission also imposed the Interim Supply Limitation (ISL), which limits the volume of water that the member agencies and San Francisco can collectively purchase from RWS to 265 MGD, until at least 2018. Although the Phased WSIP Variant included this mid-term water supply planning milestone, it also included full implementation of all proposed WSIP improvement projects to insure that the public health, seismic safety, and delivery reliability goals were achieved as soon as possible.

According to the WSIP Regional Projects Quarterly Report for the first quarter of 2012/13, all planning activities have been completed, with environmental, design and construction work at 92 percent, 96 percent, and 62 percent complete respectively.

3.1.2 2009 Water Supply Agreement

The business relationship between San Francisco and its wholesale customers is largely defined by the 2009 Water Supply Agreement, which replaced the Settlement Agreement and Master Water Sales Contract that expired in June 2009. The 2009 Water Supply Agreement addresses the rate-making methodology used by San Francisco in setting wholesale water rates for its wholesale customers, and water supply and water shortages for the RWS. The 2009 Water Supply Agreement has a 25-year term and is supplemented by Individual Water Supply Contracts.

As described above, the approved WSIP includes an ISL, to limit sales from the San Francisco RWS watersheds to an annual average of 265 MGD through 2018. The 2009 Water Supply Agreement provides for a 184 MGD “Supply Assurance” (expressed on an annual average basis) to SFPUC’s wholesale customers and an 81 MGD “Supply Assurance” to San Francisco. These assurances are subject to reduction, to the extent and for the period made necessary by reason of water shortage, due to drought, emergencies, or by malfunctioning or rehabilitation of the RWS. Although the wholesale customers did not agree to the ISL, the 2009 Water Supply Agreement provides a framework for administering the ISL, which is discussed below.

3.1.2.1 Individual Supply Guarantees

MPMWD’s Individual Supply Guarantee (ISG), as described in the 2009 Water Supply Agreement and its contract, is 4.465 MGD (or approximately 4,993 AFY).

Cal Water has three services areas that receive water from the RWS. These are the South San Francisco District, the Mid-Peninsula District and the Bear Gulch District. Cal Water’s ISG is for all three districts and totals 35.68 MGD (39,967 AFY) in normal hydrologic years. The amount available to the Bear Gulch District in any given year varies, and depends on the availability of local supplies both in Bear Gulch and in the other Cal Water districts[3]. In its 2010 UMWP, Cal Water indicated that the Bear Gulch District will receive between 11.45 and 12.85 MGD or about one third of the ISG.

Although the 2009 Water Supply Agreement and accompanying Water Supply Contracts expire in 2034, the Supply Assurance (which quantifies San Francisco’s obligation to supply water to its individual wholesale customers) survives its expiration and continues indefinitely.

Each agency’s UWMP provides additional discussion on the supply contracts.

3.1.2.2 Interim Supply Allocations

The Interim Supply Allocations (ISAs) refer to each individual wholesale customer’s share of the ISL. On December 14, 2010, the Commission established each agency’s ISA through 2018. In general, the Commission based the allocations on the lesser of the projected fiscal year 2017-18 purchase projections or the ISGs. The ISA’s are effective only until December 31, 2018, and do not affect the Supply Assurance or the ISGs.

MPMWD’s ISA is 4.1 MGD or approximately 4,590 AFY.

[3] California Water Service Company, 2010 Urban Water Management Plan Bear Gulch District, June 2011

Cal Water's ISA is 35.68 MGD, to be shared amongst its Bear Gulch, South San Francisco, and Mid-Peninsula Districts[4].

As stated in the Agreement, the wholesale customers do not concede the legality of some of the Commission's actions, including establishment of the ISA, and expressly retain the right to challenge these provisions, if and when imposed, in a court of competent jurisdiction.

3.1.3 Water Shortage Allocation Plan

The 2009 Water Supply Agreement includes a Water Shortage Allocation Plan (WSAP) that addresses shortages of up to 20 percent of system-wide use. The Tier One Shortage Plan allocates water from the RWS between San Francisco and the wholesale customers, during system-wide shortages of 20 percent or less. The WSAP also anticipated a Tier Two Shortage Plan, adopted by the wholesale customers, which would allocate the available water from the RWS among the wholesale customers.

3.1.3.1 Tier One Drought Allocations

The Tier One Shortage Plan replaced the prior Interim Water Shortage Allocation Plan, adopted in 2000, which also allocated water for shortages up to 20 percent. The Tier One Plan also allows for voluntary transfers of shortage allocations between the SFPUC and any wholesale customer and between wholesale customers themselves. In addition, water "banked" by a wholesale customer, through reductions in usage greater than required, may also be transferred. Table 3.3 illustrates the Tier One Plan Allocations.

Table 3.3 Tier 1 Drought Reductions

Level of System Wide Reduction in Water Use Required	Share Available	
	SFPUC Share	Wholesale Customers Share
5% or less	35.5%	64.5%
6% through 10%	36.0%	64.0%
11% through 15%	37.0%	63.0%
16% through 20%	37.5%	62.5%

The Tier One Plan will expire in 2034 at the end of the term of the Agreement, unless extended by SFPUC and the wholesale customers.

---

[4] California Water Service Company, 2010 Urban Water Management Plan Bear Gulch District, June 2011

3.1.3.2 Tier Two Drought Allocations

The wholesale customers have negotiated and adopted the Tier Two Plan, the second component of the WSAP, which allocates the collective wholesale customer share among each of the 26 wholesale customers. This Tier Two allocation is based on a formula that takes multiple factors for each wholesale customer into account, including:

- The ISG;
- Seasonal use of all available water supplies; and
- Residential per capita use.

The water made available to the wholesale customers collectively, will be allocated among them in proportion to each wholesale customer's Allocation Basis, expressed in MGD, which in turn is the weighted average of two components:

1. The wholesale customer's ISG that is fixed and stated in the Agreement;
2. The Base/Seasonal Component, which is variable and calculated using the monthly water use for three consecutive years prior to the onset of the drought for each of the wholesale customers for all available water supplies.

The second component is accorded twice the weight of the first fixed component in calculating the Allocation Basis. Minor adjustments to the Allocation Basis are then made to ensure a minimum cutback level, a maximum cutback level, and a sufficient supply for certain wholesale customers.

The Allocation Basis is used in a fraction, as numerator, over the sum of all wholesale customers' Allocation Bases to determine each wholesale customer's Allocation Factor. The final shortage allocation for each wholesale customer is determined by multiplying the amount of water available to the wholesale customers collectively under the Tier One Plan, by the wholesale customer's Allocation Factor.

The Tier Two Plan requires that the Allocation Factors be calculated by BAWSCA each year in preparation for a potential water shortage emergency. As the wholesale customers change their water use characteristics (e.g., increases or decreases in SFPUC purchases and use of other water sources, changes in monthly water use patterns, or changes in residential per capita water use), the Allocation Factor for each wholesale customer will also change. However, for long-term planning purposes, each wholesale customer shall use as its Allocation Factor, the value identified in the Tier Two Plan when adopted. The Tier Two Plan will expire in 2018 unless extended by the wholesale customers.

3.1.4 Reliability of the Regional Water System

The SFPUC has historically met demand in its service area in all year types from its watersheds, including the Tuolumne River watershed, the Alameda Creek watershed and the San Mateo County watersheds. In general, 85 percent of the supply comes from the Tuolumne River through Hetch Hetchy Reservoir and the remaining 15 percent comes from the local watersheds through the San Antonio, Calaveras, Crystal Springs, Pilarcitos and San Andreas Reservoirs. The adopted WSIP retains this mix of water supply for all year types.

The WSIP includes the following water supply projects to meet dry-year demands, with no greater than 20 percent system-wide rationing in any one year:

- Restoration of Calaveras Reservoir capacity
- Restoration of Crystal Springs Reservoir capacity
- Westside Basin Groundwater Conjunctive Use
- Water Transfer with Modesto Irrigation District (MID) / Turlock Irrigation District (TID)

The SFPUC has provided a projection of water supply reliability. The "Projected System Supply Reliability Based on Historical Hydrologic Period" (letter from P. Kehoe dated February 22, 2010), presents the projected RWS supply reliability under a range of hydrologic conditions and takes into account the impacts of climate change as SFPUC currently understands them.[5] This letter is included in Appendix B.

The reliability projections assume that the wholesale customers purchase 184 MGD from the RWS through 2030 and that SFPUC implements the dry-year water supply projects included in the WSIP. The projections represent the wholesale share of available supply during historical water year types per the Tier One Water Shortage Allocation Plan (WSAP). The projections do not reflect any potential impact to RWS yield from the additional fishery flows required as part of Calaveras Dam Replacement Project and the Lower Crystal Springs Dam Improvements Project, which are described below.

SFPUC has translated these dry year projections into reductions to the total 184 MGD water supply available to its wholesale customers. SFPUC's projections indicate that a 10 percent system-wide reduction in supply will occur in a single dry year and a 20 percent system-wide reduction will occur in multiple dry years. This is slightly higher than the mathematical relationship between predicted "average" and "dry years" and reflects some ability to manage dry conditions through system storage.

Table 3.4 illustrates the anticipated reductions in service reliability that could be experienced by MPMWD and Cal Water's Bear Gulch district when wholesale supplies are reduced during single dry and multiple dry water years.

[5] See MPMWD UWMP for additional discussion.

Table 3.4 - SFPUC Regional Water System Reliability

Water Supply Sources	Average/Normal Water Year Supply	Single-Dry Water Year	Multiple-Dry Water Years		
			Year 1	Year 2	Year 3
San Francisco PUC (to customers) (AFY)	206,121	170,946	170,946	148,429	148,429
Percent of Average/Normal Year	100%	83%	83%	72%	72%
MPMWD supply (AFY)	4,993	4,141	4,141	3,596	3,596
MPMWD Percent of Average/Normal Year	100%	83%	83%	72%	72%
Cal Water Bear Gulch (AFY)	14,069	11,523	11,523	11,535	11,064
Cal Water Bear Gulch Percent of Average/Normal Year	100%	82%	82%	82%	79%
Note: Cal Water information from Table 5.2-3 of 2010 UWMP. Reflects the portion of Cal Water's ISG allocated to Bear Gulch					

3.1.4.1 Impact of Recent SFPUC Actions on Dry Year Reliability of SFPUC Supplies

When it adopted the project specific approvals for the Calaveras Dam Replacement Project and the Lower Crystal Springs Dam Improvements Project, which are part of the WSIP, the SFPUC committed to providing fishery flows below Calaveras Dam and Lower Crystal Springs Dam, as well as bypass flows below Alameda Creek Diversion Dam (ACDD). Together, the fishery flow schedules represent a potential decrease in available average annual water supply of 7.4 MGD or 3.9 MGD on Alameda Creek and 3.5 MGD on San Mateo Creek. This could slightly increase the SFPUC's dry-year water supply needs and may result in a need for additional reductions in demand, increases in rationing, or a supplemental supply, each of which are described below. If these supply reductions do occur, they would be temporary. Completion of the WSIP in 2018 will result in design reliability and no more than 20 percent shortfalls.

The potential shortfall related to the fishery flow schedule for the Lower Crystal Springs Dam Improvements Project could begin in 2013. The potential shortfall related to the fishery flow schedule for the Calaveras Dam Replacement Project could begin in 2015.

3.1.4.2 Increase in Supply Rationing

The adopted WSIP provides for a dry year water supply program that, when implemented, would result in system-wide rationing of no more than 20 percent. The Programmatic Environmental Impact Report (PEIR) for the WSIP identified the following drought shortages during the design drought; 3.5 out of 8.5 years at 10 percent rationing and 3 out of 8.5 years at 20 percent.

If the SFPUC did not develop a supplemental water supply in dry years to offset the effects of the fishery flows on water supply, rationing would increase during dry years. If the SFPUC experiences a drought between 2013 and 2018, in which rationing would need to be imposed, rationing would increase by approximately 1 percent in shortage years. Basically reduced flows for fisheries could require supply rationing to increase from 20 percent to 21 percent if the maximum design drought occurs between the years 2013 and 2018. After 2018, completion of the WSIP would provide for the reliability goal of system-wide supply rationing of no more than 20 percent.

3.1.4.3 Supplemental Supply

The SFPUC may be able to manage the water supply loss associated with the fishery flows through the following actions and considerations:

- Development of additional conservation and recycling;
- Development of additional groundwater supply;
- Water transfers from MID or TID;
- Increase in Tuolumne River supply;
- Revising the Upper Alameda Creek Filter Gallery Project capacity[6]; and
- Development of a desalination project.

3.1.4.4 Meeting the Level of Service Goal for Delivery Reliability

The SFPUC has stated a commitment to meeting its contractual obligation to its wholesale customers of 184 MGD and its delivery reliability goal of 265 MGD with no greater than 20 percent rationing in any one year of a drought. The Commission is working closely with its staff to develop strategies for meeting the service goal for delivery reliability. In Resolution No. 10-0175 adopted by the Commission on October 15, 2010, staff was directed to provide information on how SFPUC has the capability to attain its water supply levels of service and contractual obligations. This directive was in response to concerns expressed by the Commission and the Wholesale Customers regarding the effect on water supply of the instream flow releases required as a result of the Lower Crystal Springs Dam Improvement Project and the Calaveras Dam Replacement Project.

While, the SFPUC has a projected shortfall of available water supply to meet its Level of Service goals and contractual obligations, the SFPUC has stated that current decreased levels of demand keep this from being an immediate problem. In the near future, the SFPUC must resolve these issues. Various activities are underway by the SFPUC to resolve the shortfall problem.

SFPUC has reported regularly on future water supply and demand balances, most recently in its 2012 Water Supply Development Report (December 3, 2012). In that report, SFPUC documented that it had implemented the Harding Park Recycled Water Project and was nearing completion on its Sharp Park Recycled Water Project, bringing new nonpotable water supplies into the service area. The 2012 Water Supply Report also documents planning progress made by BAWSCA.

---

[6] The adopted WSIP included the Alameda Creek Fishery Enhancement project, since renamed the Upper Alameda Creek Filter Gallery (UACFG) project, which had the stated purpose of recapturing downstream flows released under a 1997 California Department of Fish and Game MOU. Implementation of the UACFG project was intended to provide for no net loss of water supply as a result of the fishery flows bypassed from ACDD and/or released from Calaveras Dam. At the time the PEIR was prepared, the UACFG was described in the context of recapturing up to 6,300 AF per year. The UACFG will undergo a separate CEQA process in which all impacts associated with the project will be analyzed fully.

The 2012 Water Supply Development Report indicates that projected demands can be met with available supplies and will total less than 265 MGD in 2035. While this report supports the near-term reliability of the system, SFPUC continues to acknowledge the need to develop alternative supply strategies to make up for the instream flow reductions losses and to meet long-term demands beyond the 2018 ISL deadline.

3.2 Bay Area Water Supply and Conservation Agency

BAWSCA was created on May 27, 2003, to represent the interests of the 26 agencies that purchase water on a wholesale basis from the San Francisco RWS. MPMWD and Cal Water are both members of BAWSCA, which is the only entity that has the authority to directly represent the needs of the wholesale customers that depend on the RWS. BAWSCA also has the authority to coordinate water conservation, water supply and water recycling activities for its member agencies; acquire water and make it available to other agencies on a wholesale basis; finance projects, including improvements to the RWS; and build facilities jointly with other local public agencies or on its own to carry out the agency's purposes. There are two significant BAWSCA activities that impact the Cal Water and MPMWD's water supply and demand projections; the Water Conservation Implementation Plan (WCIP) and the Long Term Reliable Water Supply Strategy.

3.2.1 Water Conservation Implementation Plan

In September 2009, BAWSCA completed the WCIP (http://bawsca.org/docs/WCIP_FINAL_Report.pdf). The WCIP includes 37 potential demand management activities, including 32 existing measures and five new measures that were defined and developed as part of the WCIP. It is an implementation plan for BAWSCA and its member agencies to attain the water use efficiency goals that BAWSCA's member agencies committed to in 2004 as part of the Program Environmental Impact Report (PEIR) for the WSIP. The WCIP also identifies how BAWSCA member agencies can use water conservation as a way to continue to provide reliable water supplies to their customers through 2018 given the SFPUC's 265 MGD ISL. The WCIP included development of a mathematical model for each BASWCA member agencies conservation program.

Both MPMWD and Cal Water are working with BASWSC to implement water conservation programs. Water conservation efforts support the ISL commitments and allow each supplier to meet the 2020 water use target adopted with the 2010 UWMPs.

3.2.2 Long Term Reliable Water Supply Strategy

BAWSCA is developing the Long-Term Reliable Water Supply Strategy (BAWSCA Strategy) to meet the projected water needs of its member agencies and their customers through 2035 and to increase their water supply reliability under normal and drought conditions. The BAWSCA Strategy is proceeding in three phases.

Phase I was completed in 2010 and defined the magnitude of the water supply issue and the scope of work for the BAWSCA Strategy. The original schedule for the Strategy identified January 2013 as the end of the planning phase. As a result of the significant changes in projected water demands and supply needs, which directly impact the results necessary from the Strategy, the schedule for completing the Strategy has been revised. On July 3, 2012, BAWSCA released the Strategy Phase II A document which presented the results of the work to date including the following three recommended actions for consideration by the BAWSCA Board:

- Complete the Reprogrammed Phase II A work and other identified work to complete the Strategy;
- Develop a plan for a pilot water transfer with East Bay Municipal Utility District or Santa Clara Valley Water District; and
- Update the demand and water conservation projections for BAWSCA member agencies using a common methodology.

The BAWSCA Board adopted the necessary recommendations at its meeting in September 2012. The current schedule shows completion of the Strategy by December 2014. The development and implementation of the BAWSCA Strategy will be coordinated with the BAWCSA member agencies and will be adaptively managed to ensure that the goals of the BAWSCA Strategy (increased normal and drought year reliability) are efficiently and cost-effectively being met.

3.3 Groundwater

MPMWD does not currently use groundwater, but is currently evaluating several well sites in order to supplement its emergency potable and fire water supply. As discussed in its 2010 UWMP, MPMWD has conducted a series of preliminary studies and is actively pursuing the development of a well-field that could produce up to 3,000 gallons per minute (GPM) (approximately 4.32 MGD). MPMWD plans to permit the supply as an active well field for emergency use under California Department of Public Health's rules. Emergency supplies can be used for five (5) consecutive days and for less than 15 days per year. MPMWD anticipates this supply would help it address short term service interruptions, but would not provide long-term additional supply volume. MPMWD's 2010 UWMP provides additional detail on the geology of the groundwater basin and studies regarding safe yield of the basin.

Cal Water does not have any groundwater wells that supply water to the Bear Gulch District.

3.4 Surface Water

Surface water supplies approximately five precent of the Bear Gulch District's water requirements. It is collected from the Bear Gulch Creek, which drains a 1,500 acre watershed owned by Cal Water, through two diversion facilities and is stored in Bear Gulch Reservoir prior to use. This surface water is treated at the outlet of the Bear Gulch Reservoir prior to entry into the distribution system.

The Bear Gulch Reservoir relies on rainfall and surface runoff as its water supply. During dry periods, the reservoir will not replenish and this is reflected in the fact that annual production from the reservoir ranges from a high of 2,812 AF (916 MG) to a low of 319 AF (103 MG) per year. Table 3.5 illustrates the reliability of the Bear Gulch water supply as documented in Cal Water's 2010 UWMP.

Table 3.5 – Cal Water Surface Water Supply Reliability

Supply Reliability – Current Water Sources					
Water Supply Sources	**Average/Normal Water Year Supply**	**Single-Dry Water Year**	**Multiple-Dry Water Years**		
			Year 1	**Year 2**	**Year 3**

4 Water Demands

This section provides an overview of the water demand baseline and water delivery targets presented within the MPMWD and Cal Water 2010 UWMPs, and the demand projections associated with the Project.

4.1 MPMWD's UWMP Water Demand Projection

In its 2010 UWMP, MPMWD developed demand projections taking into account anticipated growth patterns and the per capita demand reduction requirements of The Water Conservation Act of 2009 (SBx7-7). SBx7-7 became effective on January 1, 2010 and requires each urban water supplier to develop a baseline per capita water use (baseline) and 2015 and 2020 water use targets. The targets generally reflect a 10 percent and 20 percent reduction from the baseline, respectively.[7]

In its 2010 UWMP, MPMWD:

- Defined baseline use as 262 gallons per capita per day (gpcd), based on water use in the period from 1996 until 2005;
- Adopted a 2015 interim target of 236 gpcd; and
- Adopted a 2020 target of 210 gpcd.

In its 2010 UWMP, MPMWD acknowledged that water use in its CII class was significantly below 2005 levels, likely reflecting the effects of economic recession. The 2010 UWMP assumed that CII demands would return to 2005 levels by 2015, reflecting planned development and economic growth. Because SBx7-7 requires overall demand reductions by 2015 and 2020, MPMWD developed a water conservation strategy that balanced meeting its water use targets while acknowledging the need for economic growth.

To meet its 2015 water use targets, MPMWD calculated that it needed to achieve 0.25 MGD in demand reductions from 2005 level. MPMWD is planning on achieving a 10 percent reduction in demand for its residential customer classes and a 2 percent savings in its landscape class to meet this target.

In order to meet its 2020 water use targets, MPMWD calculated it needed to achieve 0.62 MGD in demand reductions from 2005 levels. MPMWD is planning on achieving an additional 9 percent reduction in demand for its residential customer classes, an additional 10 percent savings in its landscape class and a 9 percent savings in its CII class between 2015 and 2020, to meet the target.

MPMWD's current demand model demonstrates that MPMWD is on track to achieve 0.36 MGD in savings, from 2005 levels, due to building code changes and its existing demand management program, illustrating that MPMWD will not only meet but exceed its 2015 target. MPMWD's 2010 UWMP

[7] There are four methods for calculating water use targets and the methods may yield different results. MPMWD's 2010 UWMP provides a detailed discussion of the baseline and target calculation.

indicated the need to identify three or four additional BASWCA programs to participate in between 2015 and 2020 to achieve the 2020 target. Because the BAWSCA program includes 37 demand management measures, MPMWD has a range of proven strategies to work with. The UWMP also identified the need to increase spending by approximately 1 percent per year to meet the targets. MPWMD will use BAWSCA's regional reporting process to track demand management progress on an annual basis.

Table 4.1 illustrates MPMWD's demand projections as outlined in its 2010 UWMP. The table illustrates that within its 2010 UWMP, MPMWD planned on very modest residential growth. It anticipated only 59 new single family accounts and 24 new multifamily accounts over the 25 year planning period.

Table 4.1- MPMWD Demand Projections from 2010 UWMP

	2010		2015		2020		2025		2030		2035

4.2 Cal Water's UWMP Water Demand Projection

Cal Water's 2010 UWMP also took into account the requirements of SBx7-7. In its 2010 UWMP for the Bear Gulch district, Cal Water:

- Computed a baseline use of 238 gallons per capita per day (gpcd), based on water use in the period from 2000 until 2009;[8]
- Adopted a 2015 interim target of 214 gpcd; and
- Adopted a 2020 target of 190 gpcd.[9]

In order to calculate future demands, Cal Water multiplied the SBx7-7 targets by the projected population within its Bear Gulch Service area. This resulted in gross future water demand projections. In order to estimate how these demands would be spread across the various water use sectors, Cal Water

[8] Table 3.3-10: California Water Service Company, 2010 Urban Water Management Plan Bear Gulch District, June 2011

[9] Table 3.3-12: California Water Service Company, 2010 Urban Water Management Plan Bear Gulch District, June 2011

used the ratio of individual deliveries for each class of demand (e.g. residential, CII, landscape), to the total historic deliveries. This ratio was applied to the total adjusted baseline demand resulting in the projected deliveries.

Table 4.2 illustrates Cal Water's demand projections for 2015, 2020 and beyond as outlined in its 2010 UWMP. The table illustrates that Cal Water did plan for some increased demand within its residential sector. In particular, the demand in the multi-family residential sector is expected to increase by 200 AFY or over 87 percent over the next 20 years.

4.3 Project Specific Water Demand Projections

4.3.1 Unit Water Demands

In its recent El Camino Real-Downtown Specific Plan EIR, the City and Cal Water considered a Water Supply Assessment for this mixed used proposal that included a number of new multifamily dwelling units, similar to the proposed Project. In this recent EIR, the City and Cal Water used a multifamily residential demand of 112 gallons per day per dwelling unit (gpd/DU) based on Santa Clara County data for multifamily units. [10] Because the proposed Project is very similar to the El Camino Real-Downtown Specific Plan EIR, the same multifamily demand will be applied. This demand factor is equivalent to 0.1255 AFY for each new unit.

[10] Water Supply Assessment for California Water Service Company Bear Gulch District and City of Menlo Park – El Camino Real/Downtown Specific Plan Project (Atkins, 2011)

4.3.2 Project Implementation Scenarios

As described in Section 1, the City has identified more potential housing sites than are required to implement the proposed Housing Plan Element. In order to bracket the water supply implications of the Project, two implementation scenarios have been developed.

- Scenario 1: This scenario has the maximum impact on MPMWD's water service area. It assumes 1,015 new units in the MPMWD service area including 900 units as a result of rezoning and 115 second units. The remaining 303 units required to fully implement the proposed Housing Element would be located in the Cal Water Service Area.

- Scenario 2: This scenario has the maximum impact on Cal Water's service area. It assumes 518 new units in the Cal Water service area including 215 as a result of rezoning, 118 in the downtown infill area, 40 second units in the West Menlo area and 145 additional second units throughout the Cal Water service area (185 second units total). The remaining 800 units required to fully implement the Housing Element would be located in the MPMWD service area.

Both scenarios assume buildout of the proposed Hamilton Avenue East and Haven sites by 2015. This would add 680 units to the MPMWD service area by 2015. The remaining units are assumed to develop at a constant rate between 2015 and 2035.

Both scenarios assume that the new demands on the Hamilton Avenue East and Haven sites are "offset" to some extent by the existing water uses that will be replaced. The Hamilton Avenue East site has an existing demand of 1.0 AFY which will help offset the project demands of 27.1 AFY.[11] The Haven site has an existing demand of 8.2 AFY which will help offset the total Project demands of 58.2 AFY[12]. Because the pattern of the remaining development proposed by the Project cannot be accurately predicted, no other "offsets" are included in the demand calculations, which results in a conservative prediction of demand.

Table 4.3 illustrates the demands associated with each scenario in each service area. Table 4.4 distributes the demand increases over the planning period from 2010 to 2035.

[11] Hamilton Ave East demand is calculates as 0.1255 AFY/unit x 216 units = 27.1 AFY total

[12] Haven demand is calculated 0.1255 AFY/unit x 464 units = 58.2 AFY total

Table 4.3 – Water Demands for Each Planning Scenario

Site Name	Number of New Units Proposed	Demand per New Unit (AFY)	Total Demand per Proposed Development (AFY)	Offsets for UWMP Planning or Existing Use	Total New Demand for Project (AFY)

4.4 Comparison to the 2010 UWMP

The estimated Project demands were compared against the 2010 UWMP demand forecasts for each water supplier, in order to determine whether sufficient allowance was made in the UWMPs for the additional residential water demands associated with the Housing Element Update developments.

4.4.1 MPMWD

In its 2010 UWMP, MPMWD projected a small increase in the residential sector including 59 new single family accounts and 24 new multifamily accounts. Multifamily accounts are not "submetered" meaning that one account can serve multiple dwelling units. However, as explained above, the 2010 UWMP also employed a strategy of achieving significant reductions in residential unit demands in order accommodate planned nonresidential growth and still meet the adopted SBx7-7 targets. Specifically, the UWMP projected that demands in the multifamily sector would fall from 333 AFY in 2010 to 294 AFY in 2035, representing a decrease of 39 AFY or approximately 12 percent.

In order to understand if the project demands can be accommodated within the multifamily sector allowance in the UWMP, the following methodology was employed:

- The existing multifamily demand of 333 AFY per year was reduced by 10 percent between 2010 and 2015 and an additional 9 percent between 2015 and 2020 consistent with the conservation plan adopted with UWMP[13];
- The 2020 demand projection for existing multifamily units was then held constant until 2035, reflecting the fact that no additional conservation measures were programed during this time;
- The projected Project demands for the period from 2015 through 2035 were then added to the reduced existing multifamily demands, creating the total projected demand for the multifamily class.

The total demand was then compared to the UWMP allocation. Table 4.5 outlines this calculation and illustrates that under both scenarios, the Project results in greater water demand in the multifamily sector than was anticipated in the UWMP.

[13] MPMWD's water conservation plan is described in Chapter 6 of its 2010 UWMP

Table 4.5 MFR Water Demand Comparison MPMWD Service Area

UWMP Allocation less Existing & Project Demands		-		(76.1)		(79.3)		(75.5)		(72.2)		(70.0)

4.4.2 Cal Water

The Cal Water 2010 UWMP for the Bear Gulch district projected growth in deliveries associated with the multifamily sector from 232 AFY (0.21 MGD) in 2010 to 433 AFY (0.39 MGD) by 2035, an increase of 201 AFY. As illustrated in Table 4.4, the Project will increase demands in the Cal Water service area by 38 to 65 AFY by 2035, depending on how the Project implementation pattern develops. This can be accommodated within the planning allowance in the UMWP.

4.4.3 Conclusion

Regardless of the implementation scenario, the proposed Project demands appear to be easily accommodated within the nonresidential growth allowance included in Cal Water's 2010 UWMP. However, the proposed Project demands exceed the demands projected for the nonresidential sector in MWPMD's 2010 UWMP and will represent an increase in demands upon that system of 70 to 97 AFY.

5 Sufficiency Analysis & Conclusions

5.1 Sufficiency Analysis

SB 610 requires that the Lead Agency make findings related to supply sufficiency under the normal, single dry and multiple dry year planning scenarios.

The adopted WSIP provides for a dry year water supply program that, when implemented, would result in system-wide rationing of no more than 20 percent. Based on the hydrologic record presented in Appendix B, the SFPUC projects a 10 percent system-wide reduction in supply will occur in a single dry year and a 20 percent system-wide reduction will occur in multiple dry years. As described in Section 3, these reductions are allocated according to a two part formula. The Tier One formula allocates reductions on a straight-line basis between the SFPUC and its wholesale customers. For example, in a Single Dry Year, SFPUC would receive a 10 percent reduction and the wholesale customers would receive a 10 percent reduction. The Tier Two formula, which is administered by BAWSCA, allocates the wholesale customer's reduced supply to each customer. This Tier Two allocation is based on a formula that takes multiple factors for each wholesale customer into account, including:

- Individual Supply Guarantee;
- Seasonal use of all available water supplies; and
- Residential per capita use.

As the wholesale customers change their water use characteristics (e.g., increases or decreases in SFPUC purchases and use of other water sources, changes in monthly water use patterns, or changes in residential per capita water use), the Allocation Factor for each wholesale customer will also change. Recent Tier Two calculations have indicated that MPWMD would receive slightly less water than a straight-line allocation would suggest (i.e., a 10 percent system wide reduction in the SFPUC supply would result in more than a 10 percent reduction for MPMWD).

5.1.1 MPMWD

The demands associated with the Housing Element Update do not fall within the demand projection allowance made in MPMWD's 2010 UWMP. Therefore, this chapter presents a revised analysis taking into account the additional water demands from the Project.

Comparisons of supply and demand under normal and single dry years are included in Tables 5.1 through 5.2 below. These tables illustrate both Project scenarios and demonstrate that the additional water demands associated with the Project will have only a small effect on the difference between supply and demand in the average and single dry years. In both these cases, the supply exceeds the demand, indicating that MPMWD will not experience water shortages in those years.

Table 5.1 - MPMWD Supply & Demand Comparison – Normal Year with Project

Difference as % of Demand	8%	19%	17%	14%	12%

Table 5.3 provides a summary of the multiple dry year supply and demand comparisons. The 2010 UWMP documented that water supply was adequate to meet demands in the first multiple dry year, but that in the second and third dry years MPMWD could experience a water shortage of up to 4 percent until the year 2015. After that point in time, the demand management required by SB x7-7 is generally sufficient to assure that demands do not exceed supply in the multiple dry year scenarios until after 2030. When the Project is taken into account, MPMWD could experience a water shortage of up to 6 percent (or 226 AFY) until the year 2015 in the second and third dry years, compared to the 4 percent (or 149 AFY) described in the 2010 UWMP. After that point, demand reductions are sufficient to ensure that in multiple dry years, demands do not exceed supply until after 2025. By 2035 in the multiple dry year scenarios, there may be a water shortage of up to 4 percent (or 132 AFY).

The demands applied in single and multiple dry years reflect the impacts of the MPMWD's conservation program, but not additional demand reduction that could be achieved by implementation of MPMWD's Drought Contingency Plan. This plan, which is described in the 2010 UWMP, outlines measures that will allow MPMWD to reduce demands by up to 50% in the case of drought or emergency. This plan will be implemented, if necessary, to manage the predicted shortages in multiple dry years.

	Difference (supply minus demand)	(225.5)	116.5	48.3	(25.9)	(104.7)
	Difference as % of Supply	-6%	3%	1%	-1%	-3%
	Difference as % of Demand	-6%	3%	1%	-1%	-3%

5.1.2 Cal Water

The growth anticipated by the Housing Element Update within Cal Water's Bear Gulch service area fall within the demand projection allowance made in the 2010 UWMP, and therefore this chapter summarizes the analysis developed for the 2010 UWMP.

Comparisons of supply and demand under normal, single dry and multiple dry years are included in Table 5.4 through 5.6 which are consistent with Tables 5.2-4 through 5.2-6 on pages 71-73 of Cal Water's 2010 UWMP for the Bear Gulch service area. The comparisons in the 2010 UWMP include Cal Water's three Peninsula Districts (Bear Gulch, Mid-Peninsula and South San Francisco) in aggregate; the supply-demand comparison is not exclusive to Cal Water's Bear Gulch area.

Cal Water's normal year supply and demand comparison shows that there is sufficient water available to meet demands through to 2030 with very modest shortages predicted in 2035.

Table 5.4 – Cal Water Supply & Demand Comparisons - Normal Year with Project

Supply and Demand Comparison – Normal Year (AFY)					
	2015	**2020**	**2025**	**2030**	**2035**
Supply Total	42,762	42,762	42,762	42,762	42,762
Demand Total	42,047	39,900	41,046	42,225	43,530
Difference (supply minus demand)	715	2,862	1,716	537	(768)
Difference as % of Supply	2%	7%	4%	1%	-2%
Difference as % of Demand	2%	7%	4%	1%	-2%

The singly dry year supply and demand comparison shows that there will be a water shortage in a single dry year. In the 2010 UWMP, the water demands were assumed to increase during a single-dry year due to maintenance of landscape and other high water uses that would normally be supplied by precipitation. Based on a 10 percent system-wide cutback in SFPUC supplies in a single-dry year, there would be a shortfall of 3,200 AF in 2015 and 3,100 AF in 2035. The 2010 UWMP notes however that historically SFPUC supplies have not been reduced this dramatically in the first year of a drought, and that under normal circumstances SFPUC has adequate carryover storage in the RWS to provide an increased level of service in single dry years. In addition, like MPMWD, Cal Water has developed a Water Shortage Contingency Plan, which allows it to implement measures that reduce demand up to 50%. This plan could be implemented to manage dry shortages as necessary.

Table 5.5 – Cal Water Supply & Demand Comparisons - Single Dry Year with Project

	2015	2020	2025	2030	2035
Supply Total	35,059	35,059	35,059	35,059	35,059
Demand Total	41,746	39,540	40,675	41,817	43,134
Difference (supply minus demand)	(6,687)	(4,481)	(5,616)	(6,758)	(8,075)
Difference as % of Supply	-19%	-13%	-16%	-19%	-23%
Difference as % of Demand	-16%	-11%	-14%	-16%	-19%

As shown in Table 5.6, there is a supply shortfall of about 1,900 AF as early as 2015 if a 10 percent system-wide reduction is required. If the cutback reaches 20 percent, Cal Water could see a shortfall of 7,900 AF beginning in 2016, and up to 9,700 AF in 2036. Cal Water indicates that it will manage these through a combination of customer demand reductions resulting from the implementation of the Water Shortage Contingency Plan, and the development of alternative supplies. Specifically, Cal Water's UWMP notes that the RWS often has "carry over" water that can be made available to its wholesale customers to buffer potential dry year cutbacks.

Table 5.6 – Cal Water Supply & Demand Comparison- Multiple Dry Years with Project

		2015	2020	2025	2030	2035
Multiple Dry Year First Year Supply	**Supply Total**	35,316	35,316	35,316	35,316	35,316
	Demand Total	37,212	35,362	36,379	37,451	38,582
	Difference (supply minus demand)	(1,896)	(46)	(1,063)	(2,135)	(3,266)
	Difference as % of Supply	-5%	0%	-3%	-6%	-9%
	Difference as % of Demand	-5%	0%	-3%	-6%	-8%
Multiple Dry Year Second Year Supply	**Supply Total**	28,522	28,522	28,522	28,522	28,522
	Demand Total	36,439	35,077	36,091	37,160	38,287
	Difference (supply minus demand)	(7,917)	(6,555)	(7,569)	(8,638)	(9,765)
	Difference as % of Supply	-28%	-23%	-27%	-30%	-34%
	Difference as % of Demand	-22%	-19%	-21%	-23%	-26%
Multiple Dry Year Third Year Supply	**Supply Total**	28,522	28,522	28,522	28,522	28,522
	Demand Total	35,404	34,548	35,552	36,610	37,762
	Difference (supply minus demand)	(6,882)	(6,026)	(7,030)	(8,088)	(9,240)
	Difference as % of Supply	-24%	-21%	-25%	-28%	-32%
	Difference as % of Demand	-19%	-17%	-20%	-22%	-24%

5.2 Capital Outlay and Permits Necessary to Accomplish the Program

Future water projects that will likely increase (improve) reliability of supplies for the City and Cal Water include:

- SFPUC's WSIP projects which are approved, funded, designed and scheduled to be complete by 2030;
- Projects that may develop through BAWSCA's Strategy which are scheduled to be identified and completed by 2018; and
- MPMWD's local groundwater development project which is scheduled to be completed by 2020.

While BAWSCA's Strategy and MPMWD's local groundwater program could result in additional water supply in the future, this WSA does not assume any water supply from these sources.

5.3 Regulatory Requirements for Delivery of Water Supply

MPMWD and Cal Water comply with all current regulatory standards. The suppliers will continue to monitor their systems in accordance with its permit from the California Department of Public Health.

5.4 Conclusions

5.4.1 MPMWD

MPMWD approved its 2010 UWMP on June 14, 2011. This document projected water supplies and demands from 2010 through 2035 and compared them under a range of hydrologic conditions.

In its 2010 UWMP, MPMWD projected that demands in the multifamily sector would decrease from 333 AFY in 2010 to 294 AFY in 2035, a decrease of 39 AFY. Demand in the single family sector was projected to decrease from 1,171 AFY in 2010 to 969 AFY in 2035, a decrease of 202 AFY. In total the Housing Element Update will add between 70 to 97 AFY in new multifamily residential demand, above and beyond what was projected in the 2010 UWMP. The actual amount of the increase will depend on the buildout pattern of the Project.

MPWMD's water supply is adequate to meet these new demands in normal and single dry years through the year 2035.

In its 2010 UMWP, MPMWD forecast that its water supply was adequate to meet demands in the first year of a multiple dry year period, but in the second and third dry years it projected a water shortage of up to 4 percent (or 149 AFY) until the year 2015. After that point in time, the demand management required by SB x7-7 would be generally be sufficient to assure that demands do not exceed supply in the multiple dry year scenarios until after 2030, when there will be a shortfall of 1 percent (or 35 AFY).

Taking into account the additional residential demands forecast in this WSA, water supply will be adequate to meet demands in the first multiple dry year, but in the second and third dry years MPMWD could experience a water shortage of up to 6 percent (226 AFY) until the year 2015. After that point in time, the demand management required by SB x7-7 would be generally sufficient to assure that demands do not exceed supply in the multiple dry year scenarios until after 2030, when there will be a shortfall of up to 4 percent (132 AFY).

These forecasts assume that "normal" demand patterns occur. The 2010 UWMP documented that MPMWD has a Water Shortage Contingency Plan (Municipal Code Chapter 7.34 Water Rationing) in place that allows it to achieve demand reductions of up to 50 percent. Therefore, the 4 to 6 percent reductions required to manage supply restrictions in multiple year droughts can be achieved by MPMWD.

Review of MPMWD's historic water delivery records indicate that in dry years, demand is depressed somewhat below "normal" levels, likely reflecting the impact of voluntary and at times, mandatory, water use reduction programs. Local groundwater (See section 3.3) could also help buffer against these anticipated shortages.

5.4.2 Cal Water

California Water Service Company approved its 2010 UWMP for the Bear Gulch District on June 24, 2011. This document projected water supplies and demands from 2010 through 2035 and compared them under a range of hydrologic conditions.

In its 2010 UWMP, Cal Water projected that demands in the multifamily sector would increase from 232 AFY in 2010 to 433 AFY in 2035, an increase of 201 AFY. Demand in the single family sector was projected to increase from 10,629 AFY in 2010 to 10,748 AFY in 2035, an increase of 119 AFY. The Housing Element Update projects will add between 38 and 65 AFY of demand to the Cal Water Service Area, which is well within the projected growth as described in the 2010 UWMP, taking into account per capita demand reductions.

Cal Water's normal year supply and demand comparison shows that there is sufficient water available to meet demands through to 2035. As per the 2010 UWMP, shortages are projected in the single and multiple dry years.

Cal Water's 2010 UWMP notes that under normal circumstances SFPUC has adequate carryover storage in the RWS to provide an increased level of service in single dry years. Like MPMWD, Cal Water has codified its Water Shortage Contingency Plan. In Cal Water's case, the Plan is codified and updated within its UWMP. Because it is a private water company, Cal Water implements its Water Shortage Contingency Plan through a California Public Utilities Commission (CPUC) process. Cal Water can make requests for "voluntary" water restrictions, which yield 10 percent demand reductions, directly to its customers in accordance with CPUC Rule 14.1. Like MPMWD, an analysis of Cal Water's historic data documents that these measures have proved sufficient to offset the system wide cutbacks during a drought period.

For mandatory restrictions, Cal Water will file a Tier 2 advice letter with the CPUC that describes the need for mandatory allocations as well as its methodology and plan for implementation. A public hearing is required during the 30 days following this filing and all customers in the affected district will be notified of the hearing. If, after the 30 day period, it is determined that mandatory allocations are necessary, Cal Water will file a Tier 1 advice letter with the CPUC, which would make mandatory allocations effective 5 days following the filing. Cal Water has the legal authority to implement mandatory allocations only after requesting from the CPUC that Tariff Rule 14.1, Mandatory Conservation Plan, be added to existing tariffs. *Section A. Conservation – Nonessential or Unauthorized Water Use* of Tariff Rule 14.1 identifies specific water use prohibitions.

WHOLESALE WATER SUPPLY AGREEMENT

Introductory Statement

Both San Francisco, as the Regional Water System owner and operator, and its Wholesale Customers share a commitment to the Regional Water System providing a reliable supply of high quality water at a fair price, and achieving these goals in an environmentally sustainable manner.

Article 1. Parties, Effective Date, and Defined Terms

1.01 Definitions

The capitalized terms used in this Agreement shall have the meanings set forth in Attachment A.

1.02 Parties

The parties to this Agreement are the City and County of San Francisco and such of the following entities (all of which purchase water from San Francisco) as have executed this Agreement:

Alameda County Water District
California Water Service Company
City of Brisbane
City of Burlingame
City of Daly City
City of East Palo Alto
City of Hayward
City of Menlo Park
City of Millbrae
City of Milpitas
City of Mountain View
City of Palo Alto
City of Redwood City

City of San Bruno
City of San José
City of Santa Clara
City of Sunnyvale
Coastside County Water District
Estero Municipal Improvement District
Guadalupe Valley Municipal Improvement District
Mid-Peninsula Water District
North Coast County Water District
Purissima Hills Water District
Skyline County Water District
Stanford University
Town of Hillsborough
Westborough Water District

The entities listed above which have executed this Agreement shall be collectively referred to as the "Wholesale Customers."

1.03 Effective Date

A. Except as provided in subsection C, this Agreement shall become effective only when it has been approved by San Francisco and by each of the entities listed in Section 1.02 and when San Francisco and each of those entities (except for the City of Hayward) have entered into an Individual Water Sales Contract as provided in Section 9.01.

B. If San Francisco and all of the entities listed in Section 1.02 approve this Agreement and (except for the City of Hayward) an Individual Water Sales Contract on or before July 1, 2009, the effective date shall be July 1, 2009. If San Francisco and all of the entities listed in Section 1.02 approve this Agreement and (except for the City of Hayward) an Individual Water Sales Contract after July 1, 2009 but on or before September 1, 2009, the effective date shall be the date on which the last entity listed in Section 1.02 approves this Agreement and, if required, an Individual Water Sales Contract.

C. If by September 1, 2009 this Agreement has been approved by fewer than all of the entities listed in Section 1.02 or fewer than all of such entities (other than the City of Hayward) have entered into an Individual Water Sales Contract, but it has been approved by entities representing at least 75% in number and 75% of the water purchased from SFPUC by all listed agencies during FY 2007-08 (i.e., 173.39 MGD), then San Francisco shall have the option to waive the requirement in subsection A that all listed agencies have approved this Agreement and an Individual Water Sales Contract as a condition precedent to this Agreement and any Individual Water Sales Contract becoming effective. San Francisco shall have 60 days from September 1, 2009 (i.e., until October 31, 2009) within which to decide whether or not to waive the condition. If San Francisco decides to waive the condition, those listed agencies that have approved this Agreement and Individual Water Sales Contract before October 31, 2009 will be bound thereby and this Agreement and Individual Water Sales Contracts will become effective as to them, as of the date of San Francisco's waiver. For purposes of determining whether listed agencies that have approved this Agreement represent at least 75% of the water purchased during FY 2007-08, the quantity of water attributable to each listed entity shall be as set forth on Attachment B.

D. The provisions of Article 9 that apply to fewer than all Wholesale Customers (i.e., Sections 9.02 - 9.07) shall not become effective unless San Francisco and the entity to which the section applies have each approved (1) this Agreement, and (2) the underlying Individual Water Sales Contract, unless otherwise provided in Article 9. This provision does not affect the continued enforceability of provisions in those sections that derive from independently enforceable judgments, orders or agreements.

Article 2. Term; Amendments During Term

2.01 <u>Term</u>

The term ("Term") of this Agreement shall be twenty five (25) years. The Term shall begin on July 1, 2009, regardless of whether the Effective Date is before or after that date, and shall end on June 30, 2034. Except as provided in Article 9, the term of all Individual Water Sales Contracts shall also begin on July 1, 2009 and end on June 30, 2034.

2.02 <u>Extension and Renewal of Term</u>

A. In December 2031, the SFPUC may provide written notice to the Wholesale Customers that it is willing to extend the Term of this Agreement. Between January 1, 2032 and June 30, 2032, any Wholesale Customer may accept the SFPUC's offer to extend the Term by providing a written notice of extension to the SFPUC. If such notices of extension are received from Wholesale Customers representing at least two-thirds in number as of June 30, 2032 and seventy five percent (75%) of the quantity of water delivered by the SFPUC to all Wholesale Customers during fiscal year 2030-31, the Term shall be extended for another five (5) years ("First Extension Term"), through June 30, 2039. No party to this Agreement which does not wish to remain a party during the Extension Term shall be compelled to do so by the actions of other parties under this section.

B. In December 2036, the SFPUC may provide written notice to the Wholesale Customers that it is willing to extend the Term of this Agreement. Between January 1, 2037 and June 30, 2037, any Wholesale Customer may accept the SFPUC's offer to extend the Term by providing a written notice of extension to the SFPUC. If such notices of extension are received from Wholesale Customers representing at least two-thirds in number as of June 30, 2037 and seventy five percent (75%) of the quantity of water delivered by the SFPUC to all Wholesale Customers during fiscal year 2035-36, the Term shall be extended for another five (5) years ("Second Extension Term"), through June 30, 2044. No party to this Agreement which does not wish to remain a party during the Extension Term shall be compelled to do so by the actions of other parties under this section.

C. After the expiration of the Term, and, if applicable, the Extension Terms, this Agreement may be renewed by mutual consent of the parties, subject to any modifications thereof which may be determined at that time. If fewer than all of the parties desire to renew this Agreement beyond its Term, with or without modifications, the SFPUC and the Wholesale

Customers who wish to extend the Agreement shall be free to do so, provided that no party to this Agreement which does not wish to become a party to such a renewed Agreement shall be compelled to do so by the actions of other parties under this section.

2.03 Amendments

A. Amendments to Agreement; General

1. This Agreement may be amended with the written consent of all parties.

2. This Agreement may also be amended with the written consent of San Francisco and of Wholesale Customers representing at least two-thirds in number (i.e., 18 as of July 1, 2009) and seventy five percent (75%) of the quantity of water delivered by San Francisco to all Wholesale Customers during the fiscal year immediately preceding the amendment.

3. No amendment which adversely affects a Fundamental Right of a Wholesale Customer may be made without the written consent of that customer. Amendments to Article 5 which merely affect the allocation of costs between City Retail customers on the one hand and Wholesale Customers collectively on the other, and amendments to Articles 6 and 7 which merely alter budgetary, accounting and auditing procedures do not affect Fundamental Rights and may be made with the consent of parties meeting the requirements of Section 2.03.A.2.

4. When an amendment has been approved by San Francisco and the number of Wholesale Customers required in Section 2.03.A.2, San Francisco shall notify each of the Wholesale Customers in writing of the amendment's adoption. Notwithstanding any provision of law or this Agreement, any Wholesale Customer that claims that the amendment violates its Fundamental Rights under Section 2.03.A.3, shall have 30 days from the date San Francisco delivers the notice of its adoption in which to challenge the amendment's validity through a judicial action. If no such action is filed within 30 days, the amendment shall be finally and conclusively deemed to have been adopted in compliance with this section.

B. Amendments to Article 9

1. Notwithstanding the provisions of Sections 2.03.A.2 and 2.03.A.3, any provision of Article 9 which applies only to an individual Wholesale Customer may be amended with the written concurrence of San Francisco and the Wholesale Customer to which it applies;

provided that the amendment will not, directly or indirectly, adversely affect the Fundamental Rights of the other Wholesale Customers.

2. Before making any such amendment effective, San Francisco shall give notice, with a copy of the text of the proposed amendment, to all other Wholesale Customers. The Wholesale Customers shall have 30 days in which to object to the amendment on the ground that it is not permissible under this subsection. If no such objection is received by San Francisco, the proposed amendment shall become effective. If one or more Wholesale Customers object to the amendment, San Francisco, the individual Wholesale Customer with which San Francisco intends to effect the amendment, and the Wholesale Customer(s) which lodged the objection shall meet to discuss the matter.

3. If the dispute cannot be resolved and San Francisco and the Wholesale Customer involved elect to proceed with the amendment, either San Francisco or the Wholesale Customer shall give written notice of such election to each Wholesale Customer that has objected. Any Wholesale Customer that has objected to such amendment shall have 30 days from receipt of this notice within which to commence an action challenging the validity of such amendment, and such amendment shall be deemed effective as of the end of this 30-day period unless restrained by order of court.

C. **Amendments to Attachments**. The following attachments may be amended with the written concurrence of San Francisco and BAWSCA on behalf of the Wholesale Customers:

Attachment	Name
G	January 2006 Water Quality Notification and Communications Plan
J	Water Use Measurement and Tabulation
L-1	Identification of WSIP Projects as Regional/Retail
N-1	Balancing Account/Rate Setting Calculation Table
N-2	Wholesale Revenue Requirement Schedules
N-3	Schedule of Projected Water Sales, Wholesale Revenue Requirement and Wholesale Rates
P	Management Representation Letter

Amendments to these attachments shall be approved on behalf of San Francisco by the Commission and on behalf of BAWSCA by its Board of Directors, unless the Commission by resolution delegates such authority to the General Manager of the SFPUC or the Board of Directors by resolution delegates such authority to the General Manager/CEO of BAWSCA.

D. **Amendments to Individual Water Sales Contracts**. Individual Water Sales Contracts described in Section 9.01 may be amended with the written concurrence of San Francisco and the Wholesale Customer which is a party to that Individual Water Sales Contract; provided that the amendment is not inconsistent with this Agreement or in derogation of the Fundamental Rights of other Wholesale Customers under this Agreement.

Article 3. Water Supply

3.01 Supply Assurance

A. San Francisco agrees to deliver water to the Wholesale Customers up to the amount of the Supply Assurance. The Supply Assurance is for the benefit of the entities listed in Section 1.02, irrespective of whether or not they have executed this Agreement. Water delivered by San Francisco to Retail Customers shall not be included in the Supply Assurance. Until December 31, 2018, the foregoing commitment is subject to Article 4.

B. Both the Supply Assurance and the Individual Supply Guarantees identified in Section 3.02 are expressed in terms of daily deliveries on an annual average basis and do not themselves constitute a guarantee by San Francisco to meet peak daily or hourly demands of the Wholesale Customers, irrespective of what those peak demands may be. The parties acknowledge, however, that the Regional Water System has been designed and constructed to meet peak daily and hourly demands and that its capacity to do so has not yet been reached. San Francisco agrees to operate the Regional Water System to meet peak requirements of the Wholesale Customers to the extent possible without adversely affecting its ability to meet peak demands of Retail Customers. This Agreement shall not preclude San Francisco from undertaking to meet specific peak demand requirements of individual Wholesale Customers in their Individual Water Sales Contracts.

C. The Supply Assurance is perpetual and shall survive the expiration or earlier termination of this Agreement. Similarly, the Individual Supply Guarantees identified in Section 3.02 and/or the Individual Water Sales Contracts are perpetual and shall survive the expiration or earlier termination of this Agreement or the Individual Water Sales Contracts.

D. Notwithstanding the Supply Assurance established by this section, the Individual Supply Guarantees identified in Section 3.02 and the Individual Water Sales Contracts, the amount of water made available by San Francisco to the Wholesale Customers is subject to reduction, to the extent and for the period made necessary by reason of water shortage, Drought, Emergencies, or by malfunctioning or rehabilitation of facilities in the Regional Water System. Any such reduction will be implemented in accordance with Section 3.11. The amount of water made available to the Wholesale Customers may not be reduced, however, merely because the water recycling and groundwater projects which the WSIP envisions to be constructed within San Francisco, or the conservation programs intended to reduce water use by Retail Customers that are included in the WSIP, do not generate the yield or savings (10 MGD combined) anticipated by San Francisco.

3.02 Allocation of Supply Assurance

A. Pursuant to Section 7.02 of the 1984 Agreement, a portion of the Supply Assurance has been allocated among 24 of the 27 Wholesale Customers. These Individual Supply Guarantees are also expressed in terms of annual average metered deliveries of millions of gallons per day and are listed in Attachment C.

B. Three Wholesale Customers do not have Individual Supply Guarantees. The cities of San Jose and Santa Clara do not have an Individual Supply Guarantees because San Francisco has provided water to them on a temporary and interruptible basis as described in Sections 4.05 and 9.06. The City of Hayward does not have an Individual Supply Guarantee because of the terms of the 1962 contract between it and San Francisco, as further described in Section 9.03.

C. If the total amount of water delivered by San Francisco to Hayward and to the Wholesale Customers that are listed on Attachment C exceeds 184 MGD over a period of three consecutive fiscal years (i.e., July 1 through June 30), then the Individual Supply Guarantees of those Wholesale Customers listed on Attachment C shall be reduced pro rata so that their combined entitlement and the sustained use by Hayward does not exceed 184 MGD. The procedure for calculating the pro rata reduction in Individual Supply Guarantees is set out in Attachment D.

1. The provisions of this subsection C are not in derogation of the reservation of claims to water in excess of the Supply Assurance which are contained in Section 8.07. Nor do they constitute an acknowledgement by Wholesale Customers other than Hayward that San Francisco is obligated or entitled to reduce their Individual Supply Guarantees in the circumstances described herein. The provisions of this subsection C shall, however, be operative unless and until a court determines that its provisions violate rights of the Wholesale Customers derived independently of this Agreement.

2. The foregoing paragraph is not intended to and shall not constitute a contractual commitment on the part of San Francisco to furnish more water than the Supply Assurance to the Wholesale Customers or a concession by San Francisco that the provisions of this subsection violate any rights of the Wholesale Customers.

D. Notwithstanding the reservation of claims contained in Sections 3.02.C and 8.07, it shall be the responsibility of each Wholesale Customer to limit its purchases of water from San Francisco so as to remain within its Individual Supply Guarantee. San Francisco shall not be liable to any Wholesale Customer or be obligated to supply more water to any Wholesale Customer individually or to the Wholesale Customers collectively than the amount to which it or they are otherwise entitled under this Agreement due to the use by any Wholesale Customer of more water than the amount to which it is entitled under this Agreement.

E. San Francisco shall install such new connections between the Regional Water System and the distribution system of any Wholesale Customer that are necessary to deliver the quantities of water to which the Wholesale Customer is entitled under this Agreement. San Francisco shall have the right to determine the location of such connections, in light of the need to maintain the structural integrity of the Regional Water System and, where applicable, the need to limit peaking directly off of Regional Water System pipelines by a Wholesale Customer's individual retail customers, the need to ensure that a Wholesale Customer's individual retail customers have access to alternative sources of water in the event of a reduction in San Francisco's ability to provide them with water, and other factors which may affect the desirability or undesirability of a particular location. San Francisco's decisions regarding the location of new connections and the location, size and type of any new meters shall not be reviewable by a court except for an abuse of discretion or failure to provide a Wholesale Customer with connections and meters adequate to deliver the quantity of water to which it is entitled under this Agreement.

3.03 <u>Wholesale Customer Service Areas</u>

A. Each of the Individual Water Sales Contracts described in Section 9.01 will contain, as an exhibit, a map of the Wholesale Customer’s service area. A Wholesale Customer may not deliver water furnished to it by San Francisco outside the boundary of its service area without the prior written consent of San Francisco, except for deliveries to another Wholesale Customer on an emergency and temporary basis pursuant to Section 3.07.B.

B. If a Wholesale Customer wishes to expand its service area, it shall request San Francisco's consent to the expansion and provide information reasonably requested by San Francisco about the amount of water projected to be purchased from San Francisco to meet demand within the area proposed to be added to the service area.

C. San Francisco may refuse a Wholesale Customer's request to expand its service area on any reasonable basis. If San Francisco denies a request by a Wholesale Customer to expand its service area, or fails to act on the request for six months after it has been submitted, the Wholesale Customer may challenge San Francisco's denial or delay in court. Such a challenge may be based on the Wholesale Customers' claim, reserved in Section 8.07, that San Francisco is obligated under federal or state law to furnish water, included within its Individual Supply Guarantee, to it for delivery outside its then-existing service area and that it is entitled to enlarge its service area to supply water to such customers. San Francisco reserves the right to contest any such claim on any applicable ground. This subsection does not apply to San Jose and Santa Clara, whose maximum service areas are fixed pursuant to Section 9.06.

D. This section will not prevent San Francisco and any Wholesale Customer, other than San Jose and Santa Clara, from agreeing in an Individual Water Sales Contract or an amendment thereto that:

- the Wholesale Customer may expand its service area without subsequent San Francisco approval to a definitive size but no larger, or

- the Wholesale Customer will not expand its service area beyond its present limits without San Francisco approval

and waiving the provisions of this section with respect to any additional expansion.

E. If two or more Wholesale Customers agree to adjust the boundaries of their respective service areas so that one assumes an obligation to serve customers in an area that was previously within the service area of another Wholesale Customer, they may also correspondingly adjust their respective Individual Supply Guarantees. Such adjustments are not subject to the requirements of Section 3.04 and shall require only the consent of San Francisco and the Wholesale Customers involved, so long as the Supply Assurance and the Individual Supply Guarantees of other Wholesale Customers are not affected. Service area boundary adjustments that would result in the expansion of any California Water Service Company service areas are subject to the requirements of Section 9.02.D. Any adjustment of service area boundaries that would result in the supply of water in violation of this Agreement or the Act shall be void.

F. San Francisco acknowledges that it has heretofore consented in writing to deliveries of water by individual Wholesale Customers outside their service area boundaries and agrees that nothing in this Agreement is intended to affect such prior authorizations, which remain in full force and effect according to their terms. Such authorizations shall be identified in the Individual Water Sales Contracts.

3.04 Permanent Transfers of Individual Supply Guarantees

A. A Wholesale Customer that has an Individual Supply Guarantee may transfer a portion of it to one or more other Wholesale Customers, as provided in this section.

B. Transfers of a portion of an Individual Supply Guarantee must be permanent. The minimum quantity that may be transferred is 1/10th of a MGD.

C. Transfers of portions of Individual Supply Guarantees are subject to approval by the SFPUC. SFPUC review is limited to determining (1) whether a proposed transfer complies with the Act, and (2) whether the affected facilities in the Regional Water System have sufficient capacity to accommodate delivery of the increased amount of water to the proposed transferee.

D. The participants in a proposed transfer shall provide notice to the SFPUC specifying the amount of the Individual Supply Guarantee proposed to be transferred, the proposed effective date of the transfer, which shall not be less than 60 days after the notice is submitted to the SFPUC, and the Individual Supply Guarantees of both participants resulting from the transfer. The SFPUC may require additional information reasonably necessary to evaluate the operational impacts of the transfer. The SFPUC will not unreasonably withhold or delay its approval; if the SFPUC does not act on the notice within 60 days, the transfer will be deemed to have been approved.

E. Within 30 days after the transfer has become effective, both the transferor and the transferee will provide notice to the SFPUC and BAWSCA. By September 30 of each year during the Term, the SFPUC and BAWSCA will prepare an updated Attachment C to reflect transfers occurring during the immediately preceding fiscal year.

F. Amounts transferred will remain subject to pro rata reduction under the circumstances described in Section 3.02.C and according to the formula set forth in Attachment D.

3.05 Restrictions on Resale

Each Wholesale Customer agrees that it will not sell any water purchased from San Francisco to a private party for resale by such private party to others in violation of the Act.

Each Wholesale Customer also agrees that it will not sell water purchased from San Francisco to another Wholesale Customer without prior written approval of the SFPUC, except on a temporary and emergency basis as permitted in Section 3.07.B.2. The SFPUC agrees that it will not unreasonably withhold its consent to a request by a Wholesale Customer to deliver water to another Wholesale Customer for resale.

3.06 <u>Conservation; Use of Local Sources; Water Management Charge</u>

A. In order to support the continuation and expansion of water conservation programs, water recycling, and development of alternative supplies within the Wholesale Customers' service areas, the SFPUC will, if requested by BAWSCA, include the Water Management Charge in water bills sent to Wholesale Customers. The SFPUC will deliver all Water Management Charge revenue to BAWSCA monthly and shall deliver an annual accounting of Water Management Charge revenue to BAWSCA within 90 days after the end of each fiscal year. The SFPUC's obligations to collect and deliver Water Management Charge revenue to BAWSCA under this subsection are conditioned on BAWSCA's delivery to the SFPUC of an annual report describing the projects and programs on which Water Management Charge funds received from the SFPUC during the previous fiscal year were expended and an estimate of the amount of water savings attributable to conservation programs and of the yield of alternative supplies developed. This report will be due within 180 days after the end of each fiscal year during which Water Management Charge funds were received.

B. The SFPUC will work together with BAWSCA to explore ways to support water conservation programs, recycling projects, and conjunctive use alternatives outside the Wholesale Service Area, in particular projects and programs that have the potential to increase both flows in the lower Tuolumne River (downstream of New Don Pedro Reservoir) and water deliveries to the Regional Water System.

C. Each Wholesale Customer shall take all actions within its legal authority related to water conservation that are necessary to insure that the SFPUC (a) remains eligible for (i) state and federal grants and (ii) access to the Drought Water Bank operated by the California Department of Water Resources, as well as other Drought-related water purchase or transfer programs, and (b) complies with future legal requirements imposed on the Regional Water System by the federal government, the State, or any other third party as conditions for receiving funding or water supply.

D. San Francisco and each Wholesale Customer agree that they will diligently apply their best efforts to use both surface water and groundwater sources located within their respective service areas and available recycled water to the maximum feasible extent, taking into account the environmental impacts, the public health effects and the effects on supply reliability of such use, as well as the cost of developing such sources.

3.07 Restrictions on Purchases of Water from Others; Minimum Annual Purchases

A. Each Wholesale Customer (except for Alameda County Water District and the cities of Milpitas, Mountain View and Sunnyvale) agrees that it will not contract for, purchase or receive, with or without compensation, directly or indirectly, from any person, corporation, governmental agency or other entity, any water for delivery or use within its service area without the prior written consent of San Francisco.

B. The prohibition in subsection A does not apply to:

1. recycled water;

2. water necessary on an emergency and temporary basis, provided that the Wholesale Customer promptly gives San Francisco notice of the nature of the emergency, the amount of water that has been or is to be purchased, and the expected duration of the emergency; or

3. water in excess of a Wholesale Customer's Individual Supply Guarantee.

C. Alameda County Water District and the cities of Milpitas, Mountain View and Sunnyvale may purchase water from sources other than San Francisco, provided that San Francisco shall require that each purchase a minimum annual quantity of water from San Francisco. These minimum quantities are set out in Attachment E and shall also be included in the Individual Water Sales Contracts between San Francisco and each of these four Wholesale Customers. The minimum purchase requirement in these Individual Water Sales Contracts will be waived during a Drought or other period of water shortage if the water San Francisco makes available to these Wholesale Customers is less than its minimum purchase quantity.

3.08 Water Quality

A. San Francisco shall deliver treated water to Wholesale Customers (except Coastside County Water District, which receives untreated water from Crystal Springs and Pilarcitos Reservoirs) that complies with primary maximum contaminant level and treatment technique standards at the regulatory entry points designated in the San Francisco Regional Water System Domestic Water Supply Permit (currently Permit No. 02-04-04P3810001) issued by the California Department of Public Health (CDPH).

B. San Francisco will provide notice to the Wholesale Customers in accordance with the Water Quality Notification and Communications Plan (current version dated January 2006), attached hereto as Attachment G. San Francisco will regularly update its plan in consultation with the Wholesale Customers and the CDPH. The next update will be completed one year after the Effective Date and include expanded coverage of secondary maximum contaminant level exceedances and water quality communication triggers. The plan will note that the Wholesale Customers will receive the same notification no later than the San Francisco water system (currently Permit No. 02-04-01P3810011) except for distribution-related issues.

C. San Francisco and the Wholesale Customers will establish a Water Quality Committee. The Water Quality Committee will meet at least quarterly to collaboratively address water quality issues, such as Water Quality Notification and Communications Plan updates, regulatory issues, and water quality planning studies/ applied research. San Francisco and each Wholesale Customer will designate a representative to serve on the committee. There will be a Chair and Vice Chair position for the Water Quality Committee. The Chair and Vice Chair positions will be held by San Francisco and the Wholesale Customers and rotate between them on an annual basis.

3.09 Completion of WSIP

San Francisco will complete construction of the physical facilities in the WSIP by December 31, 2015. The SFPUC agrees to provide for full public review and comment by local and state interests of any proposed changes that delay previously adopted project completion dates or that delete projects. The SFPUC shall meet and consult with BAWSCA before proposing to the Commission any changes in the scope of WSIP projects which reduce their capacity or ability to achieve adopted levels of service goals. The SFPUC retains discretion to determine whether to approve the physical facilities in the WSIP until after it completes the CEQA process as set forth in Section 4.07.

3.10 Regional Water System Repair, Maintenance and Operation

A. San Francisco will keep the Regional Water System in good working order and repair consistent with prudent utility practice.

B. San Francisco will submit reports to its Retail and Wholesale Customers on the "State of the Regional Water System," including reports on completed and planned maintenance, repair or replacement projects or programs, by September of every even-numbered year, with reports to start in September 2010.

C. San Francisco will cooperate with any audit of the SFPUC's asset management practices that may be initiated and financed by BAWSCA or the Wholesale Customers. BAWSCA may contract with third parties to conduct the audits. San Francisco will consider the findings and recommendations of such audits and will provide a written response indicating agreement with the recommendations, or disagreement with particular recommendations and the reasons why, within 90 calendar days after receipt.

D. San Francisco will continue to operate its reservoirs in a manner that assigns higher priority to the delivery of water to the Bay Area and the environment than to the generation of electric power. The SFPUC, as the Regional Water System operator, is solely responsible for making day-to-day operational decisions.

3.11 Shortages

A. Localized Water Reductions. Notwithstanding San Francisco's obligations to deliver the Supply Assurance to the Wholesale Customers collectively and the Individual Supply Guarantees to Wholesale Customers individually, San Francisco may reduce the amount of water available or interrupt water deliveries to specific geographical areas within the Regional Water System service area to the extent that such reductions are necessary due to Emergencies, or in order to install, repair, rehabilitate, replace, investigate or inspect equipment in, or perform other maintenance work on, the Regional Water System. Such reductions or interruptions may be imposed by San Francisco without corresponding reductions or interruptions in the amount of water available to SFPUC water users outside the specific geographical area where reductions or interruptions are necessary, if the system's ability to supply water outside the specific geographical area has not been impaired. In the event of such a reduction or interruption, San Francisco will restore the supply of water to the specific geographical area as soon as is possible. Except in cases of Emergencies (during which oral notice shall be sufficient), San Francisco will give the affected Wholesale Customer(s) reasonable written notice of such localized reductions or interruptions, the reasons therefor, and the probable duration thereof.

B. System-Wide Shortages and SFPUC Response to Regional Emergencies. Following a major system emergency event, the SFPUC will work closely with its Wholesale Customers to monitor customer demand, including the demand source. In the event that any individual Wholesale Service Area or Retail Service Area customer's uncontrolled distribution system leaks could result in major water waste and endanger the supply provided by the Regional Water System as a whole, flow through some customer connections may need to be temporarily reduced or terminated. SFPUC will work closely with customers to assess the nature of the demand (e.g. fire-fighting versus leakage), so that public health and safety protection can be given top priority.

1. All emergencies that require use of non-potable source water will require use of chlorine, or other suitable disinfectant, if feasible.

2. San Francisco will use its best efforts to meet the seismic reliability and delivery reliability level of service goals adopted by the Commission in conjunction with the WSIP. San Francisco will distribute water on an equitable basis throughout the Regional Water System service area following a regional Emergency, subject to physical limitations caused by damage to the Regional Water System.

3. San Francisco's response to Emergencies will be guided by the then-current version of the ERRP. The SFPUC shall periodically review, and the Commission may amend, the ERRP to ensure that it remains an up-to-date and effective management tool.

4. The SFPUC will give the Wholesale Customers notice of any proposal to amend the ERRP in a manner that would affect them. The notice will be delivered at least thirty days in advance of the date on which the proposal is to be considered by the Commission and will be accompanied by the text of the proposed amendment.

C. Shortages Caused by Drought; Acquisition of Dry Year Supplies. Notwithstanding San Francisco's obligations to deliver the Supply Assurance to the Wholesale Customers collectively and the Individual Supply Guarantees to Wholesale Customers individually, San Francisco may reduce the amount of water available to the Wholesale Customers in response to Drought.

1. The Tier 1 Shortage Plan (Attachment H) will continue to be used to allocate water from the Regional Water System between Retail and Wholesale Customers during system-wide shortages of 20% or less.

2. San Francisco and the Wholesale Customers may negotiate in good faith revisions to the Tier 1 Shortage Plan to adjust for and accommodate anticipated changes due to demand hardening in the SFPUC's Wholesale and Retail Service Areas. Until agreement is reached, the current Tier 1 Shortage Plan will remain in effect.

3. The SFPUC will honor allocations of water among the Wholesale Customers ("Tier 2 Allocations") provided by BAWSCA or if unanimously agreed to by all Wholesale Customers. If BAWSCA or all Wholesale Customers do not provide the SFPUC with Tier 2 Allocations, then the SFPUC may make a final allocation decision after first meeting and discussing allocations with BAWSCA and the Wholesale Customers. For Regional Water System shortages in excess of 20%, San Francisco shall (a) follow the Tier 1 Shortage Plan allocations up to the 20% reduction, (b) meet and discuss how to implement incremental reductions above 20% with the Wholesale Customers, and (c) make a final determination of allocations above the 20% reduction. After the SFPUC has made the final allocation decision, the Wholesale Customers shall be free to challenge the allocation on any applicable legal or equitable basis.

4. San Francisco will use its best efforts to identify potential sources of dry year water supplies and establish the contractual and other means to access and deliver those supplies in sufficient quantity to meet a goal of not more than 20 percent system-wide shortage in any year of the design drought.

5. San Francisco will cooperate with BAWSCA to improve water supply reliability. As an example of such cooperation, San Francisco may invite a representative of BAWSCA to attend and participate in meetings with third parties for development of dry year water supplies. If San Francisco does not invite a BAWSCA representative to attend a specific scheduled meeting, it will promptly (within 30 days of any such meeting) provide BAWSCA with a written or oral report on the meeting, including any decisions reached at it, as well as information about planned subsequent meetings. Progress in securing dry year water supplies will be reported to the SFPUC and the BAWSCA board of directors during the first quarter of each calendar year.

3.12 <u>Wheeling of Water from Outside SFPUC System</u>

Subject to the Wheeling Statute, the SFPUC will not deny use of Regional Water System unused capacity for wheeling when such capacity is available for wheeling purposes during periods when the SFPUC has declared a water shortage emergency under Water Code Section 350 if the following conditions are met:

A. The transferor pays reasonable charges incurred by the SFPUC as a result of the wheeling, including capital, operation, maintenance, administrative and replacement costs (as such are defined in the Wheeling Statute).

B. Wheeled water that is stored in the Regional Water System spills first.

C. Wheeled water will not unreasonably: (1) impact fish and wildlife resources in Regional Water System reservoirs; (2) diminish the quality of water delivered for consumptive uses; or (3) increase the risk of exotic species impairing Regional Water System operations. The transferor may at its own expense provide for treatment to mitigate these effects.

D. Priority will be given to wheeling by Wholesale Customers or BAWSCA over arrangements for third-party public entities.

3.13 Limits on New Customers

A. New Wholesale Customers Prior to December 31, 2018. Until December 31, 2018, San Francisco will not enter into contracts to supply water to any entity other than a Wholesale Customer (whether permanent or temporary, firm or interruptible) unless:

1. It completes any necessary environmental review under CEQA of the proposed new wholesale water service obligations as provided in Section 4.07;

2. It concurrently completes any necessary environmental review under CEQA as provided in Section 4.07 and commits to make both San Jose and Santa Clara permanent customers with Individual Supply Guarantees equal to at least 9 MGD; and

3. This Agreement is amended to incorporate any commitments to proposed new wholesale customers and to San Jose and Santa Clara, and to address the effects, if any, of the new customer(s) on water supply reliability, water quality and cost to existing customers of the Regional Water System.

B. New Wholesale Customers After December 31, 2018. As of January 1, 2019, San Francisco will not enter into contracts to supply water to any entity other than a Wholesale Customer (whether permanent or temporary, firm or interruptible) unless:

1. It completes any necessary environmental review under CEQA of the proposed new wholesale water service obligations as provided in Section 4.07;

2. It concurrently completes any necessary environmental review under CEQA as provided in Section 4.07 and commits to make both San Jose and Santa Clara permanent customers with Individual Supply Guarantees equal to at least 9 MGD;

3. Doing so increases the reliability of the Regional Water System; and

4. This Agreement is concurrently amended (a) to reflect that increased reliability by means of an increased commitment by San Francisco to deliver water during Droughts and (b) to address the effects, if any, of the new customer(s) on water supply, water quality and cost to existing customers of the Regional Water System.

C. <u>New Retail Customers</u>. San Francisco may enter into new retail water service obligations outside of the City and County of San Francisco:

1. Only in Alameda, San Mateo, Santa Clara, San Joaquin and Tuolumne Counties;

2. That are within or immediately adjacent to areas in which it currently serves other Retail Customers; and

3. Until the aggregate additional demand represented by the new retail customers reaches 0.5 MGD.

The limitations on serving new Retail Customers described in this subsection do not apply to historical obligations to supply water that may be contained in prior agreements between the SFPUC or its predecessor the Spring Valley Water Company, and individual users or property owners located adjacent to Regional Water System transmission pipelines.

D. <u>Water Exchanges and Cost Sharing Agreements with Other Water Suppliers</u>. Subject to completion of necessary environmental review under CEQA, San Francisco may at any time enter into water exchanges or cost sharing agreements with other water suppliers to enhance dry year or normal year water deliveries, provided that San Francisco cannot incur new water service obligations to such other water suppliers unless the requirements for taking on new wholesale customers in subsections A and B above are met.

3.14 <u>Measurement of Water</u>

A. The parties recognize that continuous and accurate measurement of water deliveries to and from the Regional Water System and maintenance of complete and accurate records of those measurements is necessary (1) for the costs of the Regional Water System to be allocated in accordance with this Agreement, (2) for implementation of other provisions of this Agreement, and (3) for effective operation and maintenance of a water system serving a large urbanized region.

B. It is the responsibility of the SFPUC to obtain and record these measurements. To do so, the SFPUC shall install, maintain and operate measuring and recording equipment at the following locations: (1) inputs to the Regional Water System from all water sources ("System Input Meters"), (2) internal flow meters to support operation of the Regional Water System ("In-Line Meters"), (3) deliveries to the City at the San Francisco-San Mateo County line ("County-Line Meters") and to three reservoirs in San Francisco ("In-City Terminal Reservoir Meters"), (4) deliveries to SFPUC Retail Customers located outside the boundaries of the City, and (5) deliveries to the Wholesale Customers, as described and illustrated in Attachment J.

C. The SFPUC shall inspect, test, service, and calibrate the measuring and recording equipment installed at the locations described in subsection B and will repair or replace them when necessary, in order to ensure that their accuracy is consistent with specifications provided in Attachment J.

D. The SFPUC shall continue to contract with a qualified independent metering consultant to perform periodic inspection, testing, servicing and calibration of the County-Line Meters, the In-City Terminal Reservoir Meters, and the System Input and In-Line Meters described in Attachment J, as well as the portion of the SFPUC's Supervisory Control and Data Acquisition (SCADA) system that utilizes the flow signals produced by that measuring and recording equipment. The method, schedule and frequency for calibration and maintenance of the County-Line Meters and the In-City Terminal Reservoir Meters are specified in Attachment J. The SFPUC shall provide copies of the metering consultant's reports to BAWSCA.

E. System Input Meters measure water deliveries into the Regional Water System from sources such as Hetch Hetchy and the SFPUC's water treatment plants. System Input Meters also measure deliveries from the Regional Water System to outside sources or from such sources to the Regional Water System through interties with the Santa Clara Valley Water District and the East Bay Municipal Utility District. In-Line Meters measure internal system flows and are located on the Bay Division Pipelines and other main transmission pipelines. These meters are collectively referred to as the "System Input and In-line Meters." Similar to the County-Line Meters, the System Input and In-Line Meters have secondary metering equipment, such as differential pressure transmitters and flow recorders. The System Input and In-Line Meters, and all associated secondary metering equipment, shall be calibrated and maintained according to the method, schedule, and frequency specified in the Procedures Manual described in subsection G, below.

F. The locations of the smaller and more numerous meters described in subsection B (4) and (5) are not illustrated in Attachment J; however, they are also critical in the determination of cost allocations, and accordingly require continued maintenance and calibration. It is the responsibility of the SFPUC to maintain the accuracy of these meters and their secondary metering equipment.

G. The SFPUC will prepare a Procedures Manual which will describe in detail the procedures for periodic inspection, testing, servicing and calibration of the measuring and recording equipment described in subsection B. Once the Procedures Manual is completed, the SFPUC and BAWSCA may agree that it should supersede some or all of the requirements in Attachment J regarding the County-Line and the In-City Terminal Reservoir Meters. Unless and until such an agreement is reached and documented, however, the requirements in Attachment J, Section D will continue in force as minimum standards for meter maintenance and calibration of the County-Line and In-City Terminal Reservoir Meters (subject to modification under the circumstances described in Attachment J, Section A.4).

H. If BAWSCA and the SFPUC are unable to agree on the water use calculations required by Attachment J for a particular year, the Wholesale Customers may file a demand for arbitration challenging the SFPUC's determination of the Wholesale Revenue Requirement for that year on the basis of its reliance on disputed water use calculations. Such a challenge must be brought in the manner and within the time specified in Section 8.01.

3.15 New Sources of Water Supply to Maintain Supply Assurance

A. Urgent Reductions of Existing Surface Water Supplies. Sudden and unanticipated events may require San Francisco to act promptly to protect the health, safety and economic well-being of its Retail and Wholesale Customers. Such sudden events include, but are not limited to drought, earthquakes, terrorist acts, catastrophic failures of facilities owned and operated by San Francisco, and other natural or man-made events. If such events diminish San Francisco's ability to maintain the Supply Assurance, San Francisco may increase the Wholesale Revenue Requirement to pay for planning, evaluation and implementation of replacement sources of supply when such needs arise and without the prior approval of the Wholesale Customers. San Francisco will keep the Wholesale Customers informed of actions being taken under this subsection, progress made, and contingency actions the Wholesale Customers may need to consider taking. To the extent appropriate and applicable, San Francisco will act in accordance with Section 3.11 and the ERRP. Nothing in this subsection limits San Francisco's obligations under Section 3.11 to pursue additional sources of supply to augment supplies available during drought.

B. Non-Urgent Reductions of Existing Surface Water Supplies. Climate change, regulatory actions and other events may impact San Francisco's ability to maintain the Supply Assurance from its existing surface water supplies, but on timescales long enough to permit San Francisco to collaborate with its Wholesale Customers on how best to address possible impacts to water supply. If such events diminish San Francisco's ability to maintain the Supply Assurance, San Francisco may increase the Wholesale Revenue Requirement to pay for planning, evaluation and implementation of replacement sources of supply when such needs arise and without the prior approval of the Wholesale Customers. San Francisco will keep the Wholesale Customers informed of actions being taken under this subsection, progress made, and contingency actions the Wholesale Customers may need to consider taking. San Francisco will solicit input and recommendations from BAWSCA and the Wholesale Customers, and take those recommendations into consideration. Prior to Commission approval of plans or taking other actions that would impact the Wholesale Revenue Requirement, San Francisco will hold a public hearing to receive written and oral comments. Nothing in this subsection modifies San Francisco's obligation to maintain the ability to provide the Supply Assurance under this Agreement.

3.16 New Sources of Water Supply to Increase Supply Assurance

A. Surface Water Supplies From Existing Watersheds After 2018. The Commission action in SFPUC Resolution Number 08-0200, adopted October 30, 2008 requires certain decisions by San Francisco regarding whether to supply more than 265 MGD from its watersheds following 2018. Such decisions are to be made by December 31, 2018, subject to the exercise of San Francisco's retained CEQA discretion in Section 4.07. San Francisco's future decisions may include an offer to increase the Supply Assurance at the request of some or all of its Wholesale Customers. Costs associated with providing additional water from its existing water supplies in San Mateo, Santa Clara, Alameda, Tuolumne, and Stanislaus Counties shall be allocated to Wholesale and Retail Customers as described in Article 5.

B. **New Water Supplies.** If San Francisco seeks to develop additional water supplies from new sources to increase the Supply Assurance available to Wholesale Customers, studies and resulting water supply projects will be conducted jointly with BAWSCA under separate agreement(s) specifying the purpose of the projects, the anticipated regional benefits and how costs of studies and implementation will be allocated and charged. Nothing in this Agreement shall serve as precedent for the allocation of such new supply capital costs between Retail and Wholesale Customers or associated operational expenses, which shall only occur following approval of both parties and amendment of this Agreement, if necessary, under Section 2.03.

3.17 Westside Basin Conjunctive Use Program

Subject to completion of necessary CEQA review as provided in Section 4.07, the SFPUC may enter into an agreement with the cities of Daly City and San Bruno and the California Water Service Company, South San Francisco Service Area ("Participating Pumpers") governing the operation of the South Westside Basin Conjunctive Use Program (“Program”), a WSIP Project. The Program would produce Regional benefits for all customers of the Regional Water System by making use of available groundwater storage capacity in the Southern portion of the Westside Basin through the supply of additional surface water (“In Lieu Water”) to the Participating Pumpers from the Regional Water System, in exchange for a corresponding reduction in groundwater pumping at existing wells owned by the Participating Pumpers. The new groundwater supply that would accrue to storage as a result of delivery of In Lieu Water would then be recovered from the SFPUC basin storage account during water shortages using new SFPUC Regional Program wells operated by the Participating Pumpers and the SFPUC. Program annual operations and maintenance expenses and water supplies are expected to be allocated as follows:

A. All In Lieu Water delivered to the Participating Pumpers shall be (1) temporary and interruptible in nature and (2) at the sole discretion of the SFPUC based on the total volume of water available to the Regional Water System.

B. All In Lieu Water delivered to the Participating Pumpers shall be considered a delivery of water to storage and shall not be construed to affect or increase the Individual Supply Guarantees of these wholesale customers or to otherwise entitle them to any claim of water in excess of their Individual Supply Guarantees or their Interim Supply Allocations. Furthermore, Environmental Enhancement Surcharges authorized under Section 4.04 will not be applied by the SFPUC to any quantity of In Lieu Water that is delivered to the Participating Pumpers, but will instead be based solely on Participating Pumper water deliveries in excess of their respective Interim Supply Allocations.

C. Any operation and maintenance expenses incurred by the Participating Pumpers and the SFPUC that are related to the operation of Regional Program wells and related assets shall be included as Regional pumping expenses under Section 5.05.B and included as part of the Wholesale Revenue Requirement. For rate setting purposes, estimated Regional Program operation and maintenance expenses shall be used as set forth in Section 6.01. Operation and maintenance expenses associated with the Participating Pumpers' existing wells that do not provide Regional benefits shall not be included in the Wholesale Revenue Requirement. On a case-by-case basis, the SFPUC may include Participating Pumper existing well operation and maintenance expenses in the Wholesale Revenue Requirement provided that such expenses (1) are solely attributable to Regional Program operations and (2) are not caused by the Participating Pumper's failure to operate and maintain its existing wells in a reasonable and prudent manner consistent with water utility industry standards.

D. The SFPUC will audit operation and maintenance expenses submitted by the Participating Pumpers for reimbursement to confirm that such costs were incurred as a result of operating Regional Program wells and related assets. Costs associated with the use of Program facilities for Direct Retail or Direct Wholesale purposes, or that do not otherwise provide Regional benefits, shall not be included in the Wholesale Revenue Requirement. The SFPUC is responsible for resolving disputes with the Participating Pumpers concerning expense allocations. Program expense documentation, including documentation of negotiation and settlement of disputed costs, will be available for review during the Compliance Audit described in Section 7.04. The Wholesale Customers may dispute the SFPUC's resolution of expense allocations through the arbitration provisions in Section 8.01 of this Agreement.

E. The SFPUC may direct the Participating Pumpers to recover water from the SFPUC basin storage account for any type of shortage referenced in Section 3.11. Water recovered from the SFPUC basin storage account using Regional Program wells may be used for (1) the benefit of all Regional Water System customers; (2) Retail Customers; or (3) one or more of the Participating Pumpers. The Wholesale Revenue Requirement shall only include operation and maintenance expenses incurred due to the operation of Program wells for Regional benefits.

F. All water recovered from the SFPUC basin storage account by the Participating Pumpers and by the SFPUC for delivery to Retail Customers during Shortages caused by Drought shall be used to free up a comparable volume of surface water from the Regional Water System for allocation in accordance with the Tier 1 Shortage Plan.

G. If the Program is terminated for any reason, including breach of the Program agreement by the Participating Pumpers or SFPUC, or due to regulatory action or legal action, then

1. Any water remaining SFPUC Regional storage account shall be used for the benefit of all customers of the Regional Water System;

2. Outstanding eligible operation and maintenance expenses, including costs incurred during recovery of remaining stored water, will be allocated as provided in this section; and

3. The Wholesale Customers will be credited with their share of proceeds from disposition of Program facilities or reimbursed their share of such capital costs for any Program facilities which are retained by the SFPUC for Direct Retail benefit and not used for the benefit of the Wholesale Customers, on the basis of (a) original cost less depreciation and outstanding related Indebtedness or (b) original cost less accumulated depreciation for revenue funded Regional Program facilities.

Article 4. Implementation of Interim Supply Limitation.

4.01 **Interim Supply Limitation Imposed by SFPUC**

In adopting the WSIP in Res. No. 08-0200, the Commission included full implementation of all proposed WSIP capital improvement projects to achieve level of service goals relating to public health, seismic safety, and delivery reliability, but decided to adopt a water supply element that includes the Interim Supply Limitation. This article describes how the parties will implement the Interim Supply Limitation imposed by the SFPUC between the Effective Date and December 31, 2018.

4.02 **Retail and Wholesale Customer Allocations Under Interim Supply Limitation**

The Interim Supply Limitation is allocated as follows between Retail and Wholesale Customers:

Retail Customers' allocation:	81 MGD
Wholesale Customers' allocation:	184 MGD

The Wholesale Customers' collective allocation of 184 MGD under the Interim Supply Limitation includes the demand of the cities of San Jose and Santa Clara, whose demand is not included in the Supply Assurance, as provided in Section 3.02.B. By December 31st, 2010, the Commission will establish each Wholesale Customer's Interim Supply Allocation at a public meeting.

4.03 **Transfers of Interim Supply Allocations**

A. Any Wholesale Customer, including Hayward, may transfer a portion of its Interim Supply Allocation to one or more other Wholesale Customers, as provided in this section. All Wholesale Customers are also eligible transferees, including California Water Service Company up to its Individual Supply Guarantee.

B. Transfers of a portion of an Interim Supply Allocation must be prospective. The duration of a transfer cannot be less than the balance of the fiscal year. The minimum quantity that may be transferred is 1/10th of a MGD.

C. Transfers of portions of Interim Supply Allocations are subject to approval by the SFPUC. SFPUC review is limited to determining (1) whether a proposed transfer complies with the Act, and (2) whether the affected facilities in the Regional Water System have sufficient capacity to accommodate delivery of the increased amount of water to the proposed transferee.

D. The participants in a proposed transfer shall provide notice to the SFPUC specifying the amount of the Interim Supply Allocation proposed to be transferred and the proposed effective date of the transfer, which shall not be less than 60 days after the notice is submitted to the SFPUC. The SFPUC may require additional information reasonably necessary to evaluate the operational impacts of the transfer. The SFPUC will not unreasonably withhold or delay its approval; if the SFPUC does not act on the notice within 60 days, the transfer will be deemed to have been approved.

E. Within 30 days after the transfer has become effective, both the transferor and the transferee will provide written notice to the SFPUC and BAWSCA.

F. Transfers of Interim Supply Allocations shall continue in effect until the earlier of (1) delivery of written notice to the SFPUC by the transfer participants that the transfer has been rescinded or (2) December 31, 2018.

4.04 Environmental Enhancement Surcharge

A. Establishment of Environmental Enhancement Surcharge. Beginning with wholesale water rates for fiscal year 2011-2012, and continuing for the duration of the Interim Supply Limitation, the Commission will establish the Environmental Enhancement Surcharge concurrently with the budget-coordinated rate process set forth in Article 6 of this Agreement. The monetary amount of the Environmental Enhancement Surcharge per volume of water, such as dollars per acre-foot, will be equivalent for Retail Customer use in excess of 81 MGD and Wholesale Customer use in excess of 184 MGD. The Environmental Enhancement Surcharge will be simple to calculate so that Wholesale Customers can estimate potential surcharges for budgeting purposes and establish retail rates within their service areas.

B. Application of Environmental Enhancement Surcharge. Beginning in fiscal year 2011-12, the Environmental Enhancement Surcharge will be levied only if and when combined Retail Customer and Wholesale Customer purchases exceed the Interim Supply Limitation of 265 MGD and if the fund described in subsection D below has been established by the San Francisco Board of Supervisors. In that event, the Environmental Enhancement Surcharge will apply to Retail Customers for use in excess of 81 MGD and to individual

Wholesale Customers for use in excess of their Interim Supply Allocations established by the Commission pursuant to Section 4.02.

1. Environmental Enhancement Surcharges related to the Retail Customers' use in excess of their 81 MGD Retail Customer Allocation will be paid by the SFPUC, and no portion of such surcharges may be allocated to Wholesale Customers. The method of recovering the Environmental Enhancement Surcharges imposed upon Retail Customers shall be within the sole discretion of the SFPUC.

2. Environmental Enhancement Surcharges related to the individual Wholesale Customers' use in excess of their respective Interim Supply Allocations will be paid to the SFPUC by individual Wholesale Customers.

C. Collection of Environmental Enhancement Surcharge. Notwithstanding the budget-coordinated rate setting process contemplated in Article 6 of this Agreement, the Environmental Enhancement Surcharge for any given year will be determined retrospectively based on actual annual usage during the fiscal year in excess of the Interim Supply Allocation and paid in equal monthly installments over the remainder of the immediately following fiscal year.

D. Establishment of Fund for Environmental Enhancement Surcharge Proceeds. Environmental Enhancement Surcharges paid by the SFPUC and by Wholesale Customers will be placed into a restricted reserve fund. The SFPUC will request the San Francisco Board of Supervisors to establish this fund by ordinance and, if adopted, the fund will be subject to the following restrictions:

1. Interest earnings will stay in the reserve fund.

2. The reserve fund shall (a) be subject to automatic appropriation; (b) require unexpended and unencumbered fund balances to be carried forward from year to year; and (c) not be transferred to the San Francisco General Fund.

3. The reserve fund may be used only for specific environmental restoration and enhancement measures for the Sierra and local watersheds, such as those included in the Watershed Environmental Improvement Program.

4. Environmental Enhancement Surcharge proceeds shall be expended in an expeditious manner. Any Environmental Enhancement Surcharge proceeds that remain in

the reserve fund as of December 31, 2018 shall be used to complete projects previously approved under subsection E. Upon completion of the identified projects, the balance of any unexpended sums in the reserve fund shall be distributed to BAWSCA and the SFPUC in proportion to the total amount of surcharges assessed to the Wholesale and Retail Customers, respectively.

E. <u>Use of Environmental Enhancement Surcharge Proceeds</u>. Specific uses of Environmental Enhancement Surcharges will be decided by the SFPUC and BAWSCA General Managers following input from environmental stakeholders and other interested members of the public. If parties are unable to agree, then they will jointly select a third person to participate in making the decision.

4.05 <u>San Jose/ Santa Clara Interim Supply Allocation and Process for Reduction/ Termination</u>.

San Francisco will supply a combined annual average of 9 MGD to the cities of San Jose and Santa Clara through 2018. Water supplied by San Francisco may only be used in the existing defined service areas in the northern portions of San Jose and Santa Clara shown on Attachment Q. San Francisco may reduce the quantity of water specified in this section when it establishes the Interim Supply Allocations for Wholesale Customers in Section 4.02. The establishment of Interim Supply Allocations for San Jose and Santa Clara shall not be considered a reduction of supply within the meaning of this section, provided that the Interim Supply Allocations assigned to San Jose and Santa Clara do not effect a reduction greater than the aggregate average reduction in Individual Supply Guarantees for Wholesale Customers that have such guarantees. The application of Interim Supply Allocations to San Jose and Santa Clara is subject to the following provisions:

A. In December 2010 and in each December thereafter through 2017, the SFPUC shall prepare and the Commission shall consider, at a regularly scheduled public meeting, a Water Supply Development Report detailing progress made toward meeting the Interim Supply Limitation by June 30, 2018.

B. The annual Water Supply Development Report shall be based on water purchase projections and work plans for achieving the Interim Supply Limitation in the Retail and Wholesale Service Areas. The projections and work plans will be prepared by the SFPUC for the Retail Customers and by BAWSCA for the Wholesale Customers, respectively, and submitted to the Commission in June of each year beginning in 2010.

C. If the Commission finds that the projections in the Water Supply Development Report show that the Interim Supply Limitation will not be met by June 30, 2018, as a result of Wholesale Customers' projected use exceeding 184 MGD, the Commission may issue a conditional five-year notice of interruption or reduction in supply of water to San Jose and Santa Clara.

D. Upon issuance of the conditional notice of interruption or reduction, the SFPUC will prepare a new analysis of water supply that will be utilized by the San Francisco Planning Department in its preparation of any necessary documentation under CEQA pursuant to Section 4.07 on the impacts of interrupting or reducing service to San Jose and Santa Clara.

E. Such notice of interruption or reduction will be rescinded if the Commission finds, based upon a subsequent annual Water Supply Development Report, that sufficient progress has been made toward meeting the Interim Supply Limitation or projections show that the Interim Supply Limitation will be met by June 30, 2018.

F. In no case shall any interruption or reduction of service to San Jose or Santa Clara pursuant to this section become effective less than two years from the completion of the CEQA process (not including resolution of any appeals or litigation) or five years from the notice, whichever is longer. If the five-year notice is issued after 2013, such interruption or reduction would occur after 2018.

G. If deliveries to San Jose and Santa Clara are interrupted, existing turnout facilities to San Jose and Santa Clara will remain in place for possible use during emergencies.

H. San Francisco and the cities of San Jose and Santa Clara will cooperate with BAWSCA and the Santa Clara Valley Water District in the identification and implementation of additional water sources and conservation measures for the cities' service areas that are relevant to the water supply and the possible offer of permanent status for the two cities by the SFPUC.

4.06 <u>San Francisco Decisions in 2018 Regarding Future Water Supply</u>

A. By December 31, 2018, San Francisco will have completed any necessary CEQA review pursuant to Section 4.07 that is relevant to making San Jose and Santa Clara permanent customers of the Regional Water System and will decide whether or not to make San Jose and Santa Clara permanent customers of the Regional Water System. San Francisco will make San Jose and Santa Clara permanent customers only if, and to the extent that, San Francisco determines that Regional Water System long term water supplies are available. In the event that San Francisco decides to afford permanent status to San Jose and Santa Clara, this Agreement will be amended pursuant to Section 2.03.

B. By December 31, 2018, San Francisco will have completed any necessary CEQA review pursuant to Section 4.07 and will decide how much water if any, in excess of the Supply Assurance it will supply to Wholesale Customers from the Regional Water System to meet their projected future water demands until the year 2030, and whether to offer a corresponding increase in the Supply Assurance as a result of its determination.

4.07 <u>Retained Discretion of SFPUC and Wholesale Customers</u>

A. This Agreement contemplates discretionary actions that the SFPUC and the Wholesale Customers may choose to take in the future that could result in physical changes to the environment ("Discretionary Actions"). The Discretionary Actions include decisions to:

1. Develop additional or alternate water resources by the SFPUC or one or more Wholesale Customers;

2. Implement the physical facilities comprising the WSIP by December 31, 2015;

3. Approve wheeling proposals by Wholesale Customers;

4. Approve new wholesale customers and water exchange or cost sharing agreements with other water suppliers;

5. Provide additional water to San Jose and/or Santa Clara;

6. Offer permanent status to San Jose and/or Santa Clara;

7. Reduce or terminate supply to San Jose and/or Santa Clara;

8. Provide additional water to Wholesale Customers in excess of the Supply Assurance to meet their projected future water demands; and

9. Offer a corresponding volumetric increase in the Supply Assurance.

The Discretionary Actions may require the SFPUC or Wholesale Customers to prepare environmental documents in accordance with CEQA prior to the SFPUC or the Wholesale Customers determining whether to proceed with any of the Discretionary Actions. Accordingly, and notwithstanding any provision of this Agreement to the contrary, nothing in this Agreement commits the SFPUC or the Wholesale Customers to approve or carry out any Discretionary Actions that are subject to CEQA. Furthermore, the SFPUC's or Wholesale Customers' decisions to approve any of these Discretionary Actions are subject to the requirement that San Francisco and each Wholesale Customer, as either a "Lead Agency" (as defined in Section 21067 of CEQA and Section 15367 of the CEQA Guidelines) or a "Responsible Agency" (as defined in Section 21069 of CEQA and Section 15381 of the CEQA Guidelines) shall have completed any CEQA-required environmental review prior to approving a proposed Discretionary Action.

B. In considering any proposed Discretionary Actions, the SFPUC and Wholesale Customers retain absolute discretion to: (1) make such modifications to any of the proposed Discretionary Actions as may be necessary to mitigate significant environmental impacts; (2) select feasible alternatives to the proposed Discretionary Actions that avoid significant adverse impacts; (3) require the implementation of specific measures to mitigate the significant adverse environmental impacts as part of the decision to approve the Discretionary Actions; (4) balance the benefits of the proposed Discretionary Actions against any significant environmental impacts before taking final actions to approve the proposed Discretionary Actions if such significant impacts cannot otherwise be avoided; or (5) determine not to proceed with the proposed Discretionary Actions.

Article 5. Wholesale Revenue Requirement

5.01 Scope of Agreement

This Article shall be applicable only to the water rates charged by San Francisco to the Wholesale Customers. Nothing contained in this Agreement shall limit, constrain, or in any way affect the rates which San Francisco may charge for water sold to Retail Customers or the methodology by which such rates are determined.

5.02 General Principles

This Article sets forth the method by which the Wholesale Customers' collective share of expenses incurred by the SFPUC in delivering water to them will be determined. This collective share is defined as the "Wholesale Revenue Requirement."

A. The SFPUC currently operates several enterprises, including the Water Enterprise, the Wastewater Enterprise, and the Hetch Hetchy Enterprise.

B. The Wastewater Enterprise is responsible for treating sewage within San Francisco and provides no benefit to the Wholesale Customers.

C. The Hetch Hetchy Enterprise is responsible for storing and transmitting water to the Water Enterprise, generating hydroelectric power and transmitting it to San Francisco, generating electric power within San Francisco, and distributing electricity and steam heat within San Francisco. Its water supply operations provide benefits to the Wholesale Customers.

D. The Water Enterprise delivers water to both Retail Customers, which are located both within and outside San Francisco, and to the Wholesale Customers, all of which are located outside San Francisco.

E. This Article implements two general principles as follows: (1) the Wholesale Customers should not pay for expenses of SFPUC operations from which they receive no benefit and (2) the Wholesale Customers should pay their share of expenses incurred by the SFPUC in delivering water to them on the basis of Proportional Annual Use unless otherwise explicitly provided in this Agreement.

F. To implement these general principles, the Wholesale Revenue Requirement will consist of, and be limited to, the Wholesale Customers' shares of the following categories of expense:

1. Capital cost recovery of Water Enterprise Existing Assets, and Hetch Hetchy Enterprise Existing Assets classified as Water-Only and the Water-Related portion of Joint assets (Section 5.03)

2. Contribution to the capital cost of Water Enterprise New Regional Assets (Section 5.04)

3. Water Enterprise operation and maintenance expenses, including power purchased from the Hetch Hetchy Enterprise that is used in the operation of the Water Enterprise (Section 5.05)

4. Water Enterprise administrative and general expenses (Section 5.06)

5. Water Enterprise property taxes (Section 5.07)

6. The Water Enterprise's share of the Hetch Hetchy Enterprise's operation and maintenance, administrative and general, and property tax expenses (Section 5.08)

7. The Water Enterprise's share of the Hetch Hetchy Enterprise's capital cost of New Assets classified as Water-Only and the Water-Related portion of Joint assets (Section 5.09)

In each of these cost categories, Direct Retail Expenses will be allocated entirely to Retail Customers. Direct Wholesale Expenses will be allocated entirely to the Wholesale Customers. Regional Expenses will be allocated between Retail Customers and Wholesale Customers as provided in this Article.

G. For purposes of establishing the rates to be charged Wholesale Customers, expenses will be based on the budget for, and estimates of water purchases in, the following fiscal year, as provided in Article 6. For purposes of accounting, the Wholesale Revenue Requirement will be determined on the basis of actual expenses incurred and actual water use, as provided in Article 7.

H. In addition, rates charged to Wholesale Customers may include the Wholesale Customers' contribution to a Wholesale Revenue Coverage Reserve, as provided in Section 6.06, which is not included in the Wholesale Revenue Requirement itself.

5.03 Capital Cost Recovery - Existing Regional Assets

A. SFPUC has previously advanced funds to acquire or construct Existing Assets used and useful in the delivery of water to both Wholesale Customers and Retail Customers. The parties estimate that the Wholesale Customers' share of the net book value of these assets, as of the expiration of the 1984 Agreement on June 30, 2009, will be approximately $366,734,424, as shown on Attachment K-1.

B. In addition, SFPUC has also previously advanced funds received from Retail Customer revenues to acquire or construct assets included in Construction-Work-In-Progress (CWIP) as of June 30, 2009. The parties estimate that the Wholesale Customers' share of the book value of these revenue funded capital expenditures, as of the expiration of the 1984 Agreement on June 30, 2009, will be approximately $15,594,990, as shown on Attachment K-2. The Wholesale Customers shall pay their share of the cost of Existing Assets and revenue-funded CWIP by amortizing the amounts shown on Attachment K-1 and Attachment K-2 over 25 years at an interest rate of 5.13 percent. The amounts to be included in the Wholesale Revenue Requirement pursuant to this section shall be the sum of the annual principal and interest amounts shown on Attachments K-3 (for Water Enterprise Regional Assets and the one Direct Wholesale Asset) and K-4 (for Hetch Hetchy Enterprise Water-Only Assets and the Water-Related portion [45 percent] of Joint assets) calculated on the basis of monthly amortization of principal as set forth on Attachments K-3 and K-4.

C. In addition, the Commission has previously appropriated funds, advanced through rates charged to Retail Customers, for construction of capital projects. Some of these projects are active, and have unexpended balances of appropriated funds that are not included in CWIP as of June 30, 2009. These projects, and the associated balances, are shown on Attachment K-5. Expenditures of funds from these balances during FY 2009-10, FY 2010-11 and FY 2011-12 will be reviewed in FY 2012-13. The SFPUC will prepare a report showing the amount expended in each year on each project and the total expended during all years on all projects that are categorized as Regional or, in the case of Hetch Hetchy Enterprise, are categorized as either Water-Only or Joint. The wholesale share of that total will be determined using the allocation principles in this Agreement based on Proportional Water Use during those three years. The result, plus accrued interest at the rate specified in Section 6.05.B, will be calculated by the SFPUC and its calculation reviewed by the Compliance Auditor as part of the Compliance Audit for FY 2012-13. The audited total will be paid based on a schedule of level annual principal and interest amounts over ten years at an interest rate of 4.00%, calculated on a monthly amortization basis. All or any portion of the balance may be prepaid. The first year's payment will be included in the Wholesale Revenue Requirement for FY 2014-15.

D. The parties agree that the Wholesale Customers' share of the net book values of Existing Regional Assets as of June 30, 2008 as shown on Attachment K-1 are accurate. The compliance audit conducted on the calculation of the FY 2008-09 Suburban Revenue Requirement required by the 1984 Agreement will determine the actual amounts of depreciation on, and capital additions to, plant in service during that fiscal year. Those amounts will be compared to the corresponding estimates shown on Attachments K-1 and K-2. The differences will be added to or subtracted from the estimated asset values shown on Attachments K-1 and K-2 and the amortization schedules in Attachments K-3 and K-4 will be recalculated. The wholesale allocation factors shall be fixed at 70.1% for the Water Enterprise Existing Assets and 64.2% for Hetch Hetchy Enterprise Existing Assets for both the preliminary and final payment schedules. The SFPUC will prepare and provide to the Wholesale Customers revised Attachments K-1 through K-4 based on the Wholesale Customers' share of the net book value of the assets placed in service as of June 30, 2009 used to provide water service to the Wholesale Customers and the net book value of revenue-funded CWIP expended as of June 30, 2009. The revised Attachments K-1 through K-4 shall be approved by the General Manager of the SFPUC and the General Manager/CEO of BAWSCA and will be substituted for the original Attachments K-1 through K-4.

E. The original Attachments K-1 through K-4, based on estimates, shall be used for estimating the Wholesale Revenue Requirement for the fiscal year beginning July 1, 2009. The revised Attachments, based on audited actuals, shall be used to determine the actual Wholesale Revenue Requirement for FY 2009-10 and to determine the Wholesale Revenue Requirement(s) in all subsequent years, except as may be provided elsewhere in this Agreement.

F. The Wholesale Customers, acting through BAWSCA, may prepay the remaining unpaid Existing Assets principal balance, in whole or in part, at any time without penalty or early payment premium. Any prepayments will be applied in the month immediately following the month in which the prepayment is made and the revised monthly amount(s) will be used to calculate the Wholesale Revenue Requirement. Any partial prepayments must be in an amount at least equal to $10 million. In the event of a partial prepayment, an updated schedule for the remaining payments shall be prepared reflecting the unpaid balance after prepayment, amortized through the end of FY 2034, calculated as provided in this section. The updated schedule, approved by the General Manager of the SFPUC and the General Manager/CEO of BAWSCA, will be substituted for Attachment K-3 and/or Attachment K-4.

5.04 Capital Cost Contribution - New Regional Assets

A. Debt-Funded Capital Additions. The Wholesale Customers shall pay the wholesale share of Net Annual Debt Service for New Regional Assets. The Regional projects in the WSIP are identified in Attachment L-1.

1. The amount of Net Annual Debt Service for New Regional Assets will be determined for each series of Indebtedness issued. Until the proceeds of a particular series are Substantially Expended, the amount attributable to specific projects will be based on the expected use of proceeds shown in the "Certificate Regarding Use of Proceeds" executed by the SFPUC General Manager on behalf of the Commission in connection with the sale of the Indebtedness, provided such certificate identifies the use of proceeds at a level of detail equivalent to that shown on Attachment L-2, which is a copy of the certificate prepared for the 2006 Revenue Bonds, Series A. If a certificate does not identify the use of proceeds at that level of detail, the SFPUC General Manager shall prepare and execute a separate certificate which does identify the use of proceeds at the level of detail shown on Attachment L-2 and deliver it to BAWSCA within 15 days from the closing of the sale of the Indebtedness.

2. After the proceeds of a series are Substantially Expended, the SFPUC General Manager will prepare and execute a certificate showing the actual expenditure of proceeds at a level of detail equivalent to the initial General Manager certificate. The resulting allocation of Net Debt Service to New Regional Assets for a series of bonds will be used in the fiscal year in which the proceeds have been Substantially Expended and thereafter. Differences between the amount of Net Debt Service paid by Wholesale Customers prior to that year and the amount of Net Debt Service that they should have paid during that time based on the actual expenditure of proceeds will be taken into account in calculation of the balancing account for the fiscal year in which the proceeds were Substantially Expended. The application of the remaining proceeds shall be proportionate to the allocation of the Net Debt Service to New Regional Assets.

3. The Wholesale Customers' share of Net Annual Debt Service for the New Regional Assets that are categorized as Direct Wholesale will be 100 percent. (None of the

projects in the WSIP are categorized as Direct Wholesale.) The Wholesale Customers' share of Net Annual Debt Service for all other New Regional Assets will be determined each year and will be equal to the Wholesale Customers' Proportional Annual Use.

4. If Indebtedness is issued by the SFPUC to refund the 2006 Revenue Bonds, Series A or to refund any other long-term Indebtedness issued after July 1, 2009, the Net Annual Debt Service attributable to proceeds used for refunding will be allocated on the same basis as the Indebtedness being refunded.

5. The SFPUC will prepare an annual report showing for each issue of Indebtedness and through the most recently completed fiscal year: (1) net financing proceeds available to pay project costs, (2) actual earnings on proceeds, (3) actual expenditures by project. The report shall be substantially in the form of Attachment L-3 and shall be delivered to BAWSCA on or before November 30 of each year, commencing November 2009.

6. In addition to Net Debt Service, Wholesale Customers will pay a proportionate share of annual administrative costs associated with Indebtedness, such as bond trustee fees, credit rating agency fees, letter of credit issuer fees, San Francisco Revenue Bond Oversight Committee fees, etc., but only to the extent such fees are neither paid from proceeds of Indebtedness nor included in SFPUC operation and maintenance or administrative and general expenses.

B. **Revenue-Funded Capital Additions**. The Wholesale Customers shall pay the wholesale share of the appropriation contained in the SFPUC annual budget for each year to be used to acquire or construct New Regional Assets. If such appropriations are reimbursed from proceeds of Indebtedness, the Wholesale Customers will be credited for prior payments made under this Section 5.04.B.

The Wholesale Customers' share of the annual appropriation for revenue-funded New Regional Assets that are categorized as Direct Wholesale will be 100 percent. (None of the Repair and Replacement projects in the SFPUC's most recent capital improvement program updated on February 10, 2009, is categorized as Direct Wholesale.) The Wholesale Customers' share of the annual appropriation for all other revenue-funded New Regional Assets will be determined each year and will be equal to the Wholesale Customers' Proportional Annual Use in each fiscal year. The amount appropriated in each fiscal year for the wholesale share of New

Regional Assets shall be contributed to the Wholesale Capital Fund described in Section 6.08 and reported on and administered as shown in that section and Attachments M-1 through M-3.

5.05 Water Enterprise Operation and Maintenance Expenses

There are five categories of Water Enterprise Operation and Maintenance Expenses, described below:

A. Source of Supply

1. Description: This category consists of the costs of labor, supervision and engineering; materials and supplies; and other expenses incurred in the operation and maintenance of collecting and impounding reservoirs, dams, wells and other water supply facilities located outside San Francisco; watershed protection; water supply planning; and the purchase of water.

2. Allocation: Direct Retail expenses, including water supply planning for Retail operations (such as City Retail water conservation programs), will be assigned to the Retail Customers. Regional expenses will be allocated between Retail Customers and Wholesale Customers on the basis of Proportional Annual Use. Direct Wholesale expenses will be assigned to the Wholesale Customers. (As of the Effective Date there are no Direct Wholesale expenses in the Source of Supply category.)

B. Pumping

1. Description: This category consists of the costs of labor, supervision and engineering; materials and supplies; and other expenses incurred in the operation and maintenance of water pumping plants, ancillary structures and equipment and surrounding grounds; and fuel and power purchased for pumping water.

2. Allocation: Direct Retail expenses will be assigned to the Retail Customers. Regional expenses will be allocated between Retail Customers and Wholesale Customers on the basis of Proportional Annual Use. Direct Wholesale expenses will be assigned to the Wholesale Customers. (As of the Effective Date there are no Direct Wholesale expenses in the Pumping category.)

C. Treatment

1. Description: This category consists of the costs of labor, supervision and engineering; materials and supplies and other expenses incurred in the operation and

maintenance of water treatment plants and drinking water quality sampling and testing. The cost of water quality testing will not include expenses incurred on behalf of the Wastewater Enterprise. Any remaining costs, after adjusting for the Wastewater Enterprise, will be reduced by the amount of revenue received for laboratory analyses of any type performed for agencies, businesses and/or individuals other than the Water and Hetch Hetchy Enterprises.

2. Allocation: Direct Retail expenses will be assigned to the Retail Customers. Regional expenses will be allocated between Retail Customers and Wholesale Customers on the basis of Proportional Annual Use. Direct Wholesale expenses will be assigned to the Wholesale Customers. (As of the Effective Date there are no Direct Wholesale expenses in the Treatment category.)

D. Transmission and Distribution

1. Description: This category consists of the cost of labor, supervision and engineering; materials and supplies; and other expenses incurred in the operation and maintenance of transmission and distribution pipelines, appurtenances, meters (other than those expenses payable by individual Wholesale Customers pursuant to Section 5.10.C.3), distribution reservoirs storing treated water, craft shops and auto shops servicing vehicles used for operation and maintenance of the Regional Water System rather than for Direct Retail facilities, and miscellaneous facilities related to the transmission and distribution of water.

2. Allocation: Direct Retail Transmission and Distribution expenses will be assigned to the Retail Customers. Regional Transmission and Distribution expenses will be allocated between Retail and Wholesale Customers on the basis of Proportional Annual Use. Expenses incurred for the operation and maintenance of three terminal reservoirs, i.e., Sunset Reservoir (North and South Basins), University Mound Reservoir (North and South Basins), and Merced Manor Reservoir, as well as transmission pipelines delivering water to them, are classified as Regional expenses notwithstanding the location of the reservoirs within San Francisco. Direct Wholesale expenses will be assigned to the Wholesale Customers. (As of the Effective Date the only Direct Wholesale expenses in the Transmission and Distribution category are associated with the Palo Alto pipeline.)

E. Customer Services

1. Description: This category consists of labor; materials and supplies; and other expenses incurred for meter reading, customer record keeping, and billing and collection for the Water Enterprise.

2. Allocation: Customer Services expenses will be allocated among the Water Enterprise, the Wastewater Enterprise, and Hetch Hetchy Enterprise in proportion to the time spent by employees in Customer Services for each operating department/enterprise. The Water Enterprise's share of Customer Services expense will be allocated 98 percent to the Retail Customers and two percent to the Wholesale Customers, as illustrated on Attachment N-2, Schedule 1.

5.06 Water Enterprise Administrative and General Expenses

Administrative and General expenses consist of the Water Enterprise's share of the cost of general government distributed through the full-cost Countywide Cost Allocation Plan, the services of SFPUC support bureaus, Water Enterprise administrative and general expenses that cannot be directly assigned to a specific operating and maintenance category, and the cost of the Compliance Audit. These four subcategories, and the method by which costs in each are to be calculated and allocated, are as follows:

A. Countywide Cost Allocation Plan

1. Description: This subcategory consists of the Water Enterprise's share of the costs of San Francisco general government and other City central service departments which are not directly billed to the Water Enterprise or other operating departments. All San Francisco operating departments are assigned a prorated share of these costs through the full-cost Countywide Cost Allocation Plan (COWCAP) prepared annually by the San Francisco Controller.

2. Allocation: The Water Enterprise's assigned share of central government costs as shown in the annual full-cost COWCAP prepared by the San Francisco Controller, will be allocated between Retail Customers and Wholesale Customers on the basis of the composite percentage of the allocated expenses in the five categories of operation and maintenance expense described in Section 5.05. The composite wholesale percentage shown on Attachment N-2, Schedule 1 is 42.07 percent, derived by dividing the wholesale share of

Operation and Maintenance expenses ($46,573,883) by total Operation and Maintenance expenses ($110,700,133).

B. Services of SFPUC Bureaus

1. Description: This subcategory consists of the support services provided to the Water Enterprise by the SFPUC Bureaus, which presently consist of the General Manager's Office, Business Services, External Affairs, and Infrastructure Bureau. Business Services presently includes Financial Services, Information Technology Services, Human Resource Services, Fleet Management, and Customer Services.

2. Allocation: There are three steps involved in determining the Wholesale Customers' share of SFPUC Bureau costs.

a. Step One: Bureau expenses which have either been recovered separately or which provide no benefit to Wholesale Customers will be excluded. Examples of Bureau expenses recovered separately include (1) Customer Services expenses, which are recovered as provided in Section 5.05.E, and (2) Infrastructure expenses, which are assigned to individual projects and capitalized. An example of a Bureau expense that provides no benefit to Wholesale Customers is Information Technology Services expenses for support of the San Francisco Municipal Railway. In addition, the SFPUC will continue its practice of assigning City Attorney Office expenses charged to the General Manager's Office for projects or lawsuits that relate to only one enterprise directly to that enterprise. For example, costs related to a lawsuit involving the Wastewater Enterprise will not be assigned to the Water Enterprise.

b. Step Two: Bureau expenses adjusted as provided in Step One will be allocated among the Water Enterprise, the Wastewater Enterprise and the Hetch Hetchy Enterprise on the basis of the actual salaries of employees in each enterprise or department, as illustrated on Attachment N-2, Schedule 7.

c. Step Three: The amount allocated to the Water Enterprise through Step Two will be allocated between Retail Customers and Wholesale Customers on the basis of Proportional Annual Use.

C. Water Enterprise Administrative and General

1. Description: This category includes expenses incurred by the Water Enterprise that are not readily assignable to specific operating divisions. This category includes the following expenses:

a. Water Administration: This includes the costs of labor and other expenses of the administrative section of the Water Enterprise, supervision and engineering expenses, professional services, travel and training, equipment purchases, and materials and supplies not directly assignable to a specific operating unit.

b. Services Provided by Other City Departments: This includes charges of other San Francisco departments directly billed to the Water Enterprise administration by other San Francisco departments for services ordered by the Water Enterprise, such as legal services, risk management, telecommunications, employee relations, purchasing, mail services, and workers compensation claims paid.

c. Litigation and Claims Paid: This includes charges incurred for attorney services and claims and judgments paid in litigation arising from the operation of the Water Enterprise.

2. Allocation: In each of these three subcategories, expenses that benefit only Retail Customers will be excluded. For example, the cost of claims and judgments resulting from a break in or leak from pipelines or reservoirs in the Retail Service Area (with the exception of the three terminal reservoirs and pipelines delivering water to them) will be assigned to the Retail Customers. Remaining Water Enterprise Administrative and General expenses will be allocated between Retail Customers and Wholesale Customers on the basis of the composite percentage of allocated operation and maintenance expense categories described in Section 5.05.

D. Compliance Audit. The cost of the Compliance Audit described in Section 7.04 will be assigned 50 percent to the Retail Customers and 50 percent to the Wholesale Customers.

5.07 Water Enterprise Property Taxes

A. Description: This category consists of property taxes levied against property owned by San Francisco located in Alameda, San Mateo and Santa Clara counties and used and managed by the SFPUC.

B. Allocation: All property taxes paid, net of (1) reimbursements received from lessees and permit holders, and (2) refunds from the taxing authority, are Regional expenses. Net property taxes will be allocated between Retail Customers and Wholesale Customers on the basis of Proportional Annual Use.

5.08 Hetch Hetchy Enterprise Expenses

A. Introduction. There are two steps involved in determining the amount of the Wholesale Customers' share of Hetch Hetchy Enterprise expenses.

1. The first step is to determine the Water Enterprise's share of Hetch Hetchy Enterprise operation expenses, maintenance expenses, administrative and general expenses, and property taxes.

2. The second step is to determine the Wholesale Customers' share of expenses allocable to the Water Enterprise.

B. Determination of the Water-Related Portion of Hetch Hetchy Enterprise Expenses

1. Operation and Maintenance Expenses: This category consists of the cost of labor, materials and supplies, and other expenses incurred in operating and maintaining Hetch Hetchy Enterprise physical facilities.

a. Description: Expenses associated exclusively with the production and distribution of hydroelectric power (e.g., generating plants and power transmission lines and towers, transformers and associated electric equipment, purchased power, wheeling charges, rental of power lines, etc.) are categorized as Power-Only and are allocated to power. Expenses associated exclusively with the operation and maintenance of facilities that serve only the water function (e.g., water transmission pipelines and aqueducts, activities related to compliance with federal and state drinking water quality laws, etc.) are categorized as Water-Only and are allocated entirely to water. Expenses associated with the operation and maintenance of facilities that serve both the water and power functions (e.g., dams, security programs, etc.) are categorized as Joint and are reallocated as 55 percent Power-Related and 45 percent Water-Related.

2. Administrative and General Expenses: There are three subcategories of Hetch Hetchy Enterprise Administrative and General expenses.

a. Full-Cost Countywide Cost Allocation Plan: This subcategory consists of the cost of San Francisco general government and other City central service departments which are not directly billed to operating departments but allocated through the full-cost Countywide Cost Allocation Plan described in Section 5.06.A. Costs in this subcategory are classified as Joint, and are reallocated as 55 percent Power-Related and 45 percent Water-Related.

b. SFPUC Bureau Costs: This subcategory consists of the expenses described in Section 5.06.B. One hundred percent of Customer Services expenses allocated to the Hetch Hetchy Enterprise are categorized as Power-Only. The remaining amount of Bureau expenses allocated to the Hetch Hetchy Enterprise pursuant to Section 5.06.B will be reallocated between power and water in proportion to the salaries of Hetch Hetchy Enterprise employees assigned to each function as shown on Attachment N-2, Schedule 7.1.

c. Other Administrative and General: This subcategory includes payments to the United States required by the Act, labor, supervision and engineering and other costs not readily assignable to a specific operation or maintenance function or program. Costs related to power administration (such as long range planning and policy analysis for energy development, administration of power contracts, and administration of work orders to City departments for energy services) are Power-Only costs. Costs related to water administration (such as legal and professional services for the protection of the City's water rights) are Water-Only costs and will be assigned to the Water Enterprise. Costs related to both power administration and water administration (such as general administration, office rents, office materials and supplies, and services of other City departments benefitting to both power and water are Joint administrative and general costs and are reallocated as 55 percent Power-Related and 45 percent Water-Related.

3. Property Taxes. This category consists of property taxes levied against property owned by San Francisco in Tuolumne, Stanislaus, San Joaquin, and Alameda counties and operated and managed by the Hetch Hetchy Enterprise.

Allocation: Property taxes are classified as Joint costs. They will be reallocated as 55 percent Power-Related and 45 percent Water-Related.

C. <u>Calculation of Wholesale Customers' Share of Hetch Hetchy Enterprise Expenses</u>. The Water Enterprise's share of Hetch Hetchy Enterprise expenses consist of 100 percent of Water-Only expenses and the Water-Related portion (45%) of Joint expenses.

The Wholesale Customers' share of the sum of the Water Enterprise's share of Hetch Hetchy Enterprise expenses determined under subsection B shall be calculated by multiplying that dollar amount by Adjusted Proportional Annual Use.

5.09 <u>Hetch Hetchy Enterprise Capital Costs</u>

A. <u>Introduction</u>. Wholesale Customers are also allocated a share of Hetch Hetchy Enterprise capital costs.

B. <u>Components of Capital Costs</u>. The components of Hetch Hetchy Enterprise capital costs are as follows:

1. <u>Existing Assets Cost Recovery</u>. The Wholesale Customers' repayment of their share of Hetch Hetchy Existing Assets (Water-Only and the Water-Related portion [45 percent] of Joint assets) is shown on Attachment K-4 accompanying Section 5.03.

2. <u>Debt Service on New Assets</u>. The Water Enterprise will be assigned 100 percent of Net Annual Debt Service attributable to acquisition and construction of New Hetch Hetchy Enterprise assets that are Water-Only and the Water-Related portion (45 percent) of Net Annual Debt Service on New Hetch Hetchy Enterprise Joint assets. The provisions of Section 5.04.A apply to debt service on New Hetch Hetchy Enterprise assets.

3. <u>Revenue-Funded Capital Additions</u>. The Water Enterprise will be assigned 100 percent of capital expenditures from revenues for New Hetch Hetchy Enterprise assets that are Water-Only and the Water-Related portion (45 percent) of such expenditures for new Hetch Hetchy Enterprise Joint assets. The provisions of Section 5.04.B apply to the payment of New revenue-funded Hetch Hetchy Enterprise assets.

C. <u>Calculation of Wholesale Customers' Share of Hetch Hetchy Enterprise Capital Costs</u>. The Wholesale Customers' share of the Net Annual Debt Service and revenue funded capital expenditures determined under subsections B.2 and 3 shall be calculated by multiplying that dollar amount by Adjusted Proportional Annual Use.

5.10 Additional Agreements Related to Financial Issues

A. Wholesale Customers Not Entitled to Certain Revenues. The Wholesale Customers have no entitlement to any of the following sources of revenue to the SFPUC.

1. Revenues from leases or sales of SFPUC real property.

2. Revenues from the other utility services such as the sale of electric power, natural gas and steam.

3. Revenues from the sale of water to customers and entities other than the Wholesale Customers.

4. Revenues earned from the investment of SFPUC funds other than funds contributed by the Wholesale Customers to the Wholesale Revenue Coverage Reserve described in Section 6.06 or the Wholesale Capital Fund described in Section 6.08. Wholesale Customers are also entitled to the benefit of earnings on proceeds of Indebtedness (through expenditure on New Regional Assets and /or application to Debt Service) and to interest on the Balancing Account as provided in Section 6.05.B.

5. Revenues not related to the sale of water.

B. Wholesale Customers Not Charged with Certain Expenses. The Wholesale Customers will not be charged with any of the following expenses:

1. Capital costs for assets constructed or acquired prior to July 1, 1984 other than Existing Asset costs that are repaid pursuant to Section 5.03.

2. Expenses incurred by the SFPUC for generation and distribution of electric power, including Hetch Hetchy Enterprise Power-Only expenses and the Power-Related share of Hetch Hetchy Enterprise Joint expenses. An exception to this is Regional energy costs incurred by the Water Enterprise, for which Wholesale Customers are charged on the basis of Proportional Annual Use.

3. Expenses incurred by SFPUC in providing water to Retail Customers.

4. Expenses associated with the SFPUC's accruals or allocations for uncollectible Retail Water accounts.

5. Attorneys' fees and costs incurred by the Wholesale Customers that a court of competent jurisdiction orders San Francisco to pay as part of a final, binding judgment against San Francisco as provided in Section 8.03.B.2.

6. Any expenses associated with funding any reserves (other than the required Wholesale Revenue Coverage Reserve described in Section 6.06) accrued and not anticipated to be paid within one year unless such reserve is established by mutual agreement of the SFPUC and BAWSCA.

7. Any expenses accrued in respect to pending or threatened litigation, damage or personal injury claims or other loss contingencies unless projected to be paid within one year. Otherwise, such expenses will be charged to the Wholesale Customers when actually paid.

8. Any expense associated with installing, relocating, enlarging, removing or modifying meters and service connections at the request of an individual Wholesale Customer.

9. The Retail Customers' portion of any Environmental Enhancement Surcharges imposed to enforce the Interim Supply Limitation set forth in Section 4.04.

C. Revenues Not Credited to Payment of Wholesale Revenue Requirement. The following payments by Wholesale Customers, individually or collectively, are not credited as Wholesale revenues for purposes of Section 6.05.B:

1. Payments by individual Wholesale Customers of the Environmental Enhancement Surcharge imposed to enforce the Interim Supply Limitation set forth in Section 4.04.

2. Payments of attorneys' fees and costs incurred by San Francisco that a court of competent jurisdiction orders the Wholesale Customers to pay as part of a final, binding judgment against the Wholesale Customers, as provided in Section 8.03.B.3.

3. Payments by individual Wholesale Customers for installation, relocation, enlargement, removal or modification of meters and service connections requested by, and charged to, a Wholesale Customer.

4. Payments applied to the amortization of the ending balance in the balancing account under the 1984 Agreement, pursuant to Section 6.05.A.

5. Payments of the Water Management Charge which are delivered to BAWSCA pursuant to Section 3.06.

6. Payments directed to the Wholesale Revenue Coverage Reserve pursuant to Section 6.06.

7. Prepayments authorized by Sections 5.03.C and 5.03.F.

D. <u>Other</u>

1. The Wholesale Customers will receive a proportional benefit from funds received by the SFPUC from (a) governmental grants, rebates, reimbursements or other subventions, (b) private-sector grants for Regional capital or operating purposes of the Water Enterprise and the Water-Only and Water-related portion of Joint Hetch Hetchy Water Enterprise expenses, or (c) a SFPUC use of taxable bonds.

2. The Wholesale Customers will receive a proportionate benefit from recovery of damages, including liquidated damages, by SFPUC from judgments against or settlements with contractors, suppliers, sureties, etc., related to Regional Water System projects and the Water-Only and Water-Related portion of Joint Hetch Hetchy Enterprise projects.

3. The SFPUC will continue to charge Wholesale Customers for assets acquired or constructed with proceeds of Indebtedness on which Wholesale Customers paid Debt Service during the Term of this Agreement on the "cash" basis (as opposed to the "utility" basis) after the expiration or earlier termination of this Agreement. The undertaking in this Section 5.10.D.3 will survive the expiration or earlier termination of this Agreement.

Article 6. Integration of Wholesale Revenue Requirement with SFPUC Budget Development and Rate Adjustments

6.01 General

A. The purpose of the allocation bases set forth in Article 5 is to determine the Wholesale Revenue Requirement for each fiscal year. The Wholesale Revenue Requirement can only be estimated in advance, based on projected costs and water deliveries. These projections are used to establish water rates applicable to the Wholesale Customers.

B. After the close of each fiscal year, the procedures described in Article 7 will be used to determine the actual Wholesale Revenue Requirement for that year, based on actual costs incurred, allocated according to the provisions of Article 5, and using actual water delivery data. The amount properly allocated to the Wholesale Customers shall be compared to the amount billed to the Wholesale Customers for the fiscal year, other than those identified in Section 5.10.C. The difference will be entered into a balancing account to be charged to, or credited to, the Wholesale Customers, as appropriate.

C. The balancing account shall be managed as described in Section 6.05.

6.02 Budget Development

The SFPUC General Manager will send a copy of the proposed SFPUC budget to BAWSCA at the same time as it is sent to the Commission. In addition, a copy of materials submitted to the Commission for consideration at meetings prior to the meeting at which the overall SFPUC budget is considered (including (a) operating budgets for the Water Enterprise and the Hetch Hetchy Enterprise, (b) budgets for SFPUC Bureaus, and (c) capital budgets for the Water Enterprise and the Hetch Hetchy Enterprise) will also be sent to BAWSCA concurrently with their submission to the Commission.

6.03 Rate Adjustments

A. Budget Coordinated Rate Adjustments. Adjustments to the rates applicable to the Wholesale Customers shall be coordinated with the budget development process described in this section except to the extent that Sections 6.03.B and 6.03.C authorize emergency rate increases and drought rate increases, respectively.

If the SFPUC intends to increase wholesale water rates during the ensuing fiscal year, it will comply with the following procedures:

1. Adjustments to the wholesale rates will be adopted by the Commission at a regularly scheduled meeting or at special meeting, properly noticed, called for the purpose of adjusting rates or for taking any other action under the jurisdiction of the Commission.

2. The SFPUC will send a written notice by mail or electronic means to each Wholesale Customer and to BAWSCA of the recommended adjustment at least thirty (30) days prior to the date of the meeting at which the Commission will consider the proposed adjustment. The notice will include the date, time and place of the Commission meeting.

3. The SFPUC shall prepare and provide to each Wholesale Customer and to BAWSCA the following materials: (a) a table illustrating how the increase or decrease in the Wholesale Revenue Requirement and wholesale rates were calculated, substantially in the form of Attachment N-1, (b) a schedule showing the projected expenses included in the Wholesale Revenue Requirement for the fiscal year for which the rates are being proposed, and supporting materials, substantially in the form of Attachment N-2, and (c) a schedule showing projected water sales, Wholesale Revenue Requirements and wholesale rates for the fiscal year for which rates are being set and the following four years, substantially in the form of Attachment N-3. These materials will be included with the notification required by Section 6.03.A.2.

4. Rate adjustments will be effective no sooner than thirty (30) days after adoption of the wholesale rate by the Commission.

5. San Francisco will use its best efforts to provide the Wholesale Customers with the information described above. San Francisco's failure to comply with the requirements set forth in this section shall not invalidate any action taken by the Commission (including, but not limited to, any rate increase or decrease adopted). In the event of such failure, the Wholesale Customers may either invoke arbitration, as set forth in Section 8.01, or seek injunctive relief, to compel San Francisco to remedy the failure as soon as is reasonably practical, and San Francisco shall be free to oppose the issuance of the requested judicial or arbitral relief on any applicable legal or equitable basis. The existence of this right to resort to arbitration shall not be deemed to preclude the right to seek injunctive relief.

6. Because delays in the budget process or other events may cause San Francisco to defer the effective date of Wholesale Customer rate adjustments until after the beginning of San Francisco's fiscal year, nothing contained in this Agreement shall require San Francisco to make any changes in the water rates charged to Wholesale Customers effective at

the start of San Francisco's fiscal year or at any other specific date. Nothing in the preceding sentence shall excuse non-compliance with the provisions of Section 6.02 and this section.

B. **Emergency Rate Increases**. The Commission may adjust the Wholesale Customers' rates without complying with the requirements of Section 6.03.A in response to an Emergency that damages the Regional Water System and disrupts San Francisco's ability to maintain normal deliveries of water to Retail and Wholesale Customers. In such an Emergency, the Commission may adopt an emergency rate surcharge applicable to Wholesale Customers without following the procedures set forth in this section, provided that any such rate surcharge imposed by the Commission shall be applicable to both Retail and Wholesale Customers and incorporate the same percentage increase for all customers. Any emergency rate surcharge adopted by the Commission shall remain in effect only until the next-budget coordinated rate-setting cycle.

C. **Drought Rates**. If the Commission declares a water shortage emergency under Water Code Section 350, implements the Tier 1 Shortage Plan (Attachment H) described in Section 3.11.C, and imposes drought rates on Retail Customers, it may concurrently adjust wholesale rates independently of coordination with the annual budget process. Those adjustments may be designed to encourage water conservation and may constitute changes to the structure of the rates within the meaning of Section 6.04. The parties agree, however, that, in adopting changes in rates in response to a declaration of water shortage emergency, the Commission shall comply with Section 6.03.A.1 and 2 but need not comply with Section 6.04.B. Drought Rate payments and payments of excess use charges levied in accordance with the Tier 1 Shortage Plan described in Section 3.11.C constitute Wholesale Customer Revenue and count towards the Wholesale Revenue Requirement. The SFPUC may use these revenues to purchase additional water for the Wholesale Customers from the State Drought Water Bank or other willing seller.

6.04 **Rate Structure**

A. This Agreement is not intended and shall not be construed to limit the Commission's right (a) to adjust the structure of the rate schedule applicable to the Wholesale Customers (i.e., the relationship among the several charges set out therein) or (b) to add, delete, or change the various charges which make up the rate schedule, provided that neither such charges nor the structure of the rate schedule(s) applicable to the Wholesale Customers shall be arbitrary, unreasonable, or unjustly discriminatory as among said customers. The

SFPUC will give careful consideration to proposals for changes in the rate schedule made jointly by the Wholesale Customers but, subject to the limitations set out above, shall retain the sole and exclusive right to determine the structure of the rate schedule.

B. If the SFPUC intends to recommend that the Commission adopt one or more changes to the structure of wholesale rates (currently set forth in SFPUC Rate Schedule W-25), it shall prepare and distribute to the Wholesale Customers and BAWSCA a report describing the proposed change(s), the purpose(s) for which it/they are being considered, and the estimated financial effect on individual Wholesale Customers or classes of customers. Wholesale Customers may submit comments on the report to the SFPUC for sixty (60) days after receiving the report. The SFPUC will consider these comments and, if it determines to recommend that the Commission adopt the change(s), as described in the report or as modified in response to comments, the SFPUC General Manager shall submit a report to the Commission recommending specific change(s) in the rate structure. Copies of the General Manager's report shall be sent to all Wholesale Customers and BAWSCA at least thirty (30) days prior to the Commission meeting at which the changes will be considered.

C. The SFPUC may recommend, and the Commission may adopt, changes in the structure of wholesale rates at any time. However, the new rate schedule implementing these changes will become effective at the beginning of the following fiscal year.

6.05 Balancing Account

A. Balancing Account Established Under 1984 Agreement. The amount of credit in favor of San Francisco as of the expiration of the term of 1984 Agreement (June 30, 2009) is not known with certainty as of preparation and execution of this Agreement. It will not be known with certainty until the Compliance Audit for FY 2008-09 is completed and disputes, if any, that the Wholesale Customers or the SFPUC may have with the calculation of the Suburban Revenue Requirement for that fiscal year and for previous fiscal years have been settled or decided by arbitration.

The parties anticipate that the amount of the credit in favor of San Francisco as of June 30, 2009 may be within the range of $15 million to $20 million.

In order to reduce the credit balance due San Francisco under the 1984 Agreement in an orderly manner, while avoiding unnecessary fluctuations in wholesale rates, the parties agree to implement the following procedure.

1. In setting wholesale rates for FY 2009-10, SFPUC will include a balancing account repayment of approximately $2 million.

2. In setting wholesale rates for FY 2010-11 and following years, SFPUC will include a balancing account repayment of not less than $2 million and not more than $5 million annually until the full amount of the balance due, plus interest at the rate specified in Section 6.05.B, is repaid.

3. The actual ending balance as of June 30, 2009 will be determined, by the parties' agreement or arbitral ruling, after the Compliance Audit report for FY 2008-09 is delivered to BAWSCA. That amount, once determined, will establish the principal to be amortized through subsequent years' repayments pursuant to this Section 6.05.A.

B. Balancing Account Under This Agreement

1. Operation. After the close of each fiscal year, the SFPUC will compute the costs allocable to the Wholesale Customers for that fiscal year pursuant to Article 5, based on actual costs incurred by the SFPUC and actual amounts of water used by the Wholesale Customers and the Retail Customers. That amount will be compared to the amounts billed to the Wholesale Customers for that fiscal year (including any Excess Use Charges, but excluding revenues described in Section 5.10.C). The difference will be posted to a "balancing account" as a credit to, or charge against, the Wholesale Customers. Interest shall also be posted to the balancing account calculated by multiplying the amount of the opening balance by the average net interest rate, certified by the Controller as earned in the San Francisco Treasury for the previous fiscal year on the San Francisco County Pooled Investment Account. Interest, when posted, will carry the same mathematical sign (whether positive or negative) as carried by the opening balance. The amount posted to the balancing account in each year shall be added to, or subtracted from, the balance in the account from previous years. The calculation of the amount to be posted to the balancing account shall be included in the report prepared by the SFPUC pursuant to Section 7.02.

The opening balance for fiscal year 2009-10 shall be zero.

2. Integration of Balancing Account with Wholesale Rate Setting Process. If the amount in the balancing account is owed to the Wholesale Customers (a positive balance), the SFPUC shall take it into consideration in establishing wholesale rates. However, the SFPUC need not apply the entire amount to reduce wholesale rates for the immediately ensuing

year. Instead, the SFPUC may prorate a positive ending balance over a period of up to three successive years in order to avoid fluctuating decreases and increases in wholesale rates.

a. If a positive balance is maintained for three successive years and represents 10 percent or more of the Wholesale Revenue Requirement for the most recent fiscal year, the SFPUC shall consult with BAWSCA as to the Wholesale Customers' preferred application of the balance. The Wholesale Customers shall, through BAWSCA, direct that the positive balance be applied to one or more of the following purposes: (a) transfer to the Wholesale Revenue Coverage Reserve, (b) amortization of any remaining negative balance from the ending balancing account under the 1984 Agreement, (c) prepayment of the existing asset balance under Section 5.03, (d) water conservation or water supply projects administered by or through BAWSCA, (e) immediate reduction of wholesale rates, or (f) continued retention for future rate stabilization purposes. In the absence of a direction from BAWSCA, the SFPUC shall continue to retain the balance for rate stabilization in subsequent years.

b. If the amount in the balancing account is owed to the SFPUC (a negative balance), the SFPUC shall not be obligated to apply all or any part of the negative balance in establishing wholesale rates for the immediately ensuring year. Instead, the SFPUC may prorate the negative balance in whole or in part over multiple years in order to avoid fluctuating increases and decreases in wholesale rates.

6.06 <u>Wholesale Revenue Coverage Reserve</u>

A. The SFPUC may include in wholesale rates for any fiscal year an additional dollar amount ("Wholesale Revenue Coverage"), which for any fiscal year shall equal the following:

1. The lesser of (i) 25% of the Wholesale Customers' share of Net Annual Debt Service for that fiscal year determined as described in Section 5.04.A, or (ii) the amount necessary to meet the Wholesale Customers' proportionate share of Debt Service coverage required by then-current Indebtedness for that fiscal year, minus

2. A credit for (i) the actual amounts previously deposited in the "Wholesale Revenue Coverage Reserve" (as defined in subsection B below), (ii) accrued interest on the amounts on deposit in the Wholesale Revenue Coverage Reserve, and (iii) an amount equal to any additional interest that would have accrued on the actual amounts previously deposited in

the Wholesale Revenue Coverage Reserve assuming no withdrawals had been made therefrom.

B. During each fiscal year, the SFPUC will set aside and deposit that portion of revenue equal to Wholesale Revenue Coverage into a separate account that the SFPUC will establish and maintain, to be known as the "Wholesale Revenue Coverage Reserve." Deposits into the Wholesale Revenue Coverage Reserve shall be made no less frequently than monthly. The Wholesale Revenue Coverage Reserve shall be credited with interest at the rate specified in Section 6.05.B. The SFPUC may use amounts in the Wholesale Revenue Coverage Reserve for any lawful purpose. Any balance in the Wholesale Revenue Coverage Reserve in excess of the Wholesale Revenue Coverage amount as of the end of any fiscal year (as calculated in subsection 6.06(A) above) shall be applied as a credit against wholesale rates in the immediately following fiscal year unless otherwise directed by BAWSCA.

C. Within 180 days following the later of expiration of the Term or final payment of Debt Service due on Indebtedness issued during the Term to which Wholesale Customers were contributing, SFPUC shall rebate to the Wholesale Customers an amount equal to the Wholesale Revenue Coverage amount in effect for the fiscal year during which the Term expires or the final payment of Debt Service on Indebtedness is made based on each Wholesale Customer's Proportional Annual Use in the fiscal year during which the Term expires or the final payment of debt service on Indebtedness is made.

D. SFPUC shall provide a schedule of debt issuance (with assumptions), and the Wholesale Customers' share of Net Annual Debt Service (actual and projected) expected to be included in wholesale rates starting in 2009-10 through the expected completion of the WSIP. The schedule is to be updated annually prior to rate setting. If estimated Debt Service is used in rate setting, the SFPUC must be able to demonstrate that the Water Enterprise revenues will be sufficient to meet the additional bonds test for the proposed bonds and rate covenants for the upcoming year.

E. Conditions in the municipal bond market may change from those prevailing in 2009. If, prior to expiration of the Term, the SFPUC determines that it would be in the best financial interest of both Retail Customers and Wholesale Customers of the Regional Water System for the Debt Service coverage requirement to be increased in one or more series of proposed new Indebtedness above 1.25%, or for the coverage covenant to be strengthened in other ways, it will provide a written report to BAWSCA. The report will contain (1) a description of proposed covenant(s) in the bond indenture; (2) an explanation of how savings are expected to be achieved (e.g., increase in the SFPUC's credit rating over the then-current level; ability to obtain credit enhancement, etc.); (3) the estimated all-in true interest cost savings; (4) a comparison of the Wholesale Revenue Requirements using the Debt Service coverage limitation in subsection A and under the proposed methodology; and (5) a comparison of the respective monetary benefits expected to be received by both Retail and Wholesale Customers. The SFPUC and BAWSCA agree to meet and confer in good faith about the proposed changes.

F. Any increase in Debt Service coverage proposed by the SFPUC shall be commensurate with Proportional Water Use by Retail and Wholesale Customers. If the SFPUC demonstrates that an increase in Debt Service coverage will result in equivalent percentage reductions in total Wholesale and Retail Debt Service payments over the life of the proposed new Indebtedness, based on Proportional Water Use, BAWSCA may agree to a modification of the Wholesale Revenue Coverage requirement in subsection A. If BAWSCA does not agree to a proposed modification in coverage requirements in the covenants for new Indebtedness, SFPUC may nevertheless proceed with the modification and the issuance of new Indebtedness. Any Wholesale Customer, or BAWSCA, may challenge an increase in the Wholesale Revenue Requirement resulting from the modification in Debt Service coverage through arbitration as provided in Section 8.01.A. If the arbitrator finds that the increase in Debt Service coverage (1) did not and will not result in equivalent percentage reductions in total Wholesale and Retail Debt Service payments over the life of the proposed new Indebtedness, based on Proportional Water Use, or (2) was not commensurate with Proportional Water Use, the arbitrator may order the Wholesale Revenue Requirement to be recalculated both retrospectively and prospectively to eliminate the differential impact to Wholesale or Retail Customers, subject to the limitation in Section 8.01.C.

6.07 <u>Working Capital Requirement</u>

A. The SFPUC maintains working capital in the form of unappropriated reserves for the purpose of bridging the gap between when the SFPUC incurs operating expenses required to provide service and when it receives revenues from its Retail and Wholesale Customers. The Wholesale Customers shall fund their share of working capital as part of the annual Wholesale Revenue Requirement calculation. The amount of wholesale working capital for which the Wholesale Customers will be responsible will be determined using the 60-day standard formula approach.

B. Applying this approach, annual wholesale working capital equals one-sixth of the wholesale allocation of operation and maintenance, administrative and general, and property tax expenses for the Water and Hetch Hetchy Enterprises. Wholesale working capital shall be calculated separately for the Water and Hetch Hetchy Enterprises.

C. Each month, the sum of the Water Enterprise and Hetch Hetchy Enterprise working capital components will be compared with the ending balance in the Wholesale Revenue Coverage Reserve to determine if the Wholesale Customers provided the minimum required working capital. If the Wholesale Revenue Coverage Reserve is greater than the total Water Enterprise and Hetch Hetchy Enterprise working capital requirement, the Wholesale Customers will have provided their share of working capital. If the Wholesale Revenue Coverage Reserve is less than the total Water Enterprise and Hetch Hetchy Enterprise working capital requirement, the Wholesale Customers will be charged interest on the difference, which will be included in the adjustment to the Balancing Account under Section 6.05.B for the subsequent fiscal year.

6.08 <u>Wholesale Capital Fund</u>

A. The SFPUC currently funds revenue-funded capital projects through annual budget appropriations that are included in rates established for that fiscal year and transferred to a capital project fund from which expenditures are made. Consistent with the San Francisco Charter and Administrative Code, the SFPUC appropriates funds in advance of construction in order to maintain a positive balance in the capital project fund. The capital project fund also accrues interest and any unspent appropriations in excess of total project costs. It is the SFPUC's practice to regularly monitor the capital project fund balance to determine whether a surplus has accumulated, which can be credited against the next fiscal year's capital project appropriation.

B. The SFPUC shall establish a comparable Wholesale Revenue-Funded Capital Fund (Wholesale Capital Fund) to enable the Wholesale Customers to fund the wholesale share of revenue-funded New Regional Assets. The Wholesale Capital Fund balance is zero as of July 1, 2009. The SFPUC may include in wholesale rates for any fiscal year an amount equal to the wholesale share of the SFPUC's appropriation for revenue funded New Regional Assets for that year, which sum will be credited to the Wholesale Capital Fund. The wholesale share of other sources of funding, where legally permitted and appropriately accounted for under GAAP, will also be credited to the Wholesale Capital Fund, together with interest earnings on the Wholesale Capital Fund balance.

C. The SFPUC will expend revenues appropriated and transferred to the Wholesale Capital Fund only on New Regional Assets. The annual capital appropriation included in each fiscal year's budget will be provided to BAWSCA in accordance with Section 6.02 and will take into account the current and projected balance in the Wholesale Capital Fund, as well as current and projected unexpended and unencumbered surplus, as shown on attachment M-1, which will be prepared by the SFPUC each year.

D. Commencing on November 30, 2010 and thereafter in each fiscal year during the Term, the SFPUC will also provide an annual report to BAWSCA on the status of individual revenue-funded New Regional Assets, substantially in the form of Attachment M-2.

E. In order to prevent the accumulation of an excessive unexpended and unencumbered surplus in the Wholesale Capital Fund, the status of the fund balance will be reviewed through the Compliance Audit at five-year intervals, commencing in FY 2014-15. Any excess fund balance (i.e., an accumulated unexpended, unencumbered amount in excess of ten percent (10%) of the wholesale share of total capital appropriations for New Regional Assets during the five preceding years) will be transferred to the credit of the Wholesale Customers to the Balancing Account described in Section 6.05. Attachment M-3 illustrates the operation of this review process, covering FY 2009-10 through FY 2013-14 and FY 2014-15 through 2018-19.

F. Three years prior to the end of the Term, the SFPUC and BAWSCA will discuss the disposition of the Wholesale Capital Fund balance at the end of the Term. Absent agreement, any balance remaining in the Wholesale Capital Fund at the end of the Term shall be transferred to the Balancing Account, to the credit of the Wholesale Customers.

Article 7. Accounting Procedures; Compliance Audit

7.01 SFPUC Accounting Principles, Practices

A. Accounting Principles. San Francisco will maintain the accounts of the SFPUC and the Water and Hetch Hetchy Enterprises in conformity with Generally Accepted Accounting Principles. San Francisco will apply all applicable pronouncements of the Governmental Accounting Standards Board (GASB) as well as statements and interpretations of the Financial Accounting Standards Board and Accounting Principles Board opinions issued on or before March 30, 1989, unless those pronouncements or opinions conflict with GASB pronouncements.

B. General Rule. San Francisco will maintain the accounting records of the SFPUC and the Water and Hetch Hetchy Enterprises in a format and level of detail sufficient to allow it to determine the annual Wholesale Revenue Requirement in compliance with this Agreement and to allow its determination of the Wholesale Revenue Requirement to be audited as provided in Section 7.04.

C. Water Enterprise. San Francisco will maintain an account structure which allows utility plant and operating and maintenance expenses to be segregated by location (inside San Francisco and outside San Francisco) and by function (Direct Retail, Regional and Direct Wholesale).

D. Hetch Hetchy Enterprise. San Francisco will maintain an account structure which allows utility plant and operating and maintenance expenses to be segregated into Water Only, Power Only and Joint categories.

E. SFPUC. San Francisco will maintain an account structure which allows any expenses of SFPUC bureaus that benefit only the Wastewater Enterprise, the Power-Only operations of the Hetch Hetchy Enterprise or Retail Customers to be excluded from the Wholesale Revenue Requirement.

F. Utility Plant Ledgers. San Francisco will maintain subsidiary plant ledgers for the Water and Hetch Hetchy Enterprises that contain unique identifying numbers for all assets included in the rate base and identify the original cost, annual depreciation, accumulated depreciation, date placed in service, useful life, salvage value if any, source of funding (e.g., bond series, revenues, grants), and classification for purposes of this Agreement.

G. **<u>Debt</u>.** San Francisco will maintain documentation identifying:

1. The portion of total bonded debt outstanding related to each series of each bond issue.

2. The portion of total interest expense related to each series of each bond issue.

3. The use of proceeds of each bond issue (including proceeds of commercial paper and/or other interim financial instruments redeemed or expected to be redeemed from bonds and earnings on the proceeds of financings) in sufficient detail to determine, for each bond issue, the proceeds and earnings of each (including proceeds and earnings of interim financing vehicles redeemed by a bond issue) and the total amounts expended on Direct Retail improvements and the total amounts expended on Regional improvements.

H. **<u>Changes in Accounting</u>.** Subject to subsections A thru G, San Francisco may change the chart of accounts and accounting practices of the SFPUC and the Water and Hetch Hetchy Enterprises. However, the allocation of any expense to the Wholesale Customers that is specified in the Agreement may not be changed merely because of a change in (1) the accounting system or chart of accounts used by SFPUC, (2) the account to which an expense is posted or (3) a change in the organizational structure of the SFPUC or the Water or Hetch Hetchy Enterprises.

I. **<u>Audit</u>.** San Francisco will arrange for an audit of the financial statements of Water and Hetch Hetchy Enterprises to be conducted each year by an independent certified public accountant, appointed by the Controller, in accordance with Generally Accepted Auditing Standards.

7.02 <u>Calculation of and Report on Wholesale Revenue Requirement</u>

A. Within five months after the close of each fiscal year, San Francisco will prepare a report showing its calculation of the Wholesale Revenue Requirement for the preceding fiscal year and the change in the balancing account as of the end of that fiscal year. The first such report will be prepared by November 30, 2010 and will cover fiscal year 2009-10 and the balancing account as of June 30, 2010.

B. The report will consist of the following items:

1. Statement of changes in the balancing account for the fiscal year being reported on, and for the immediately preceding fiscal year, substantially in the form of Attachment O.

2. Detailed supporting schedules 8.1 through 8.2 substantially in the form of Attachment N-2.

3. Description and explanation of any changes in San Francisco's accounting practices from those previously in effect.

4. Explanation of any line item of expense (shown on Attachment N-2, schedules 1 and 4) for which the amount allocated to the Wholesale Customers increased by (a) ten percent or more from the preceding fiscal year, or (b) more than $1,000,000.

5. Representation letter signed by the SFPUC General Manager and by other SFPUC financial staff shown on Attachment P, as the General Manager may direct, subject to change in position titles at the discretion of the SFPUC.

C. The report will be delivered to the BAWSCA General Manager by the date identified in Subsection A.

Once the report has been delivered to BAWSCA, San Francisco will, upon request:

1. Provide BAWSCA with access to, and copies of, all worksheets and supporting documents used or prepared by San Francisco during its calculation of the Wholesale Revenue Requirement;

2. Make available to BAWSCA all supporting documentation and calculations used by San Francisco in preparing the report; and

3. Promptly provide answers to questions from BAWSCA staff about the report.

7.03 Appointment of Compliance Auditor

A. Purpose. The purpose of this section is to provide for an annual Compliance Audit by an independent certified public accountant of the procedures followed and the underlying data used by San Francisco in calculating the Wholesale Revenue Requirement for the preceding fiscal year. The annual Compliance Audit shall also determine whether the Wholesale Revenue Requirement has been calculated in accordance with the terms of the Agreement and whether amounts paid by the Wholesale Customers in excess of or less than the Wholesale Revenue Requirement have been posted to the balancing account, together with interest as provided in Section 6.05.

B. Method of Appointment. The Controller shall select an independent certified public accountant ("Compliance Auditor") to conduct the Compliance Audit described below. The Compliance Auditor may be the same certified public accountant engaged by the Controller to audit the financial statements of the Water and Hetch Hetchy Enterprises. Subject to approval by the Controller and the General Manager of the SFPUC, the Compliance Auditor shall have the authority to engage such consultants as it deems necessary or appropriate to assist in the audit. The terms of this Article shall be incorporated into the contract between San Francisco and the Compliance Auditor, and the Wholesale Customers shall be deemed to be third-party beneficiaries of said contract.

7.04 Conduct of Compliance Audit

A. Standards. The Compliance Auditor shall perform the Compliance Audit in accordance with Generally Accepted Auditing Standards. In particular, its review shall be governed by the standards contained in Section AU 623 (Reports on Specified Elements, Accounts or Items of a Financial Statement) of the AICPA, *Professional Standards*, as amended from time to time.

B. Preliminary Meeting; Periodic Status Reports; Access to Data. Prior to commencing the audit, the Compliance Auditor shall meet with San Francisco and BAWSCA to discuss the audit plan, the procedures to be employed and the schedule to be followed. During the course of the audit, the Compliance Auditor shall keep San Francisco and BAWSCA informed of any unforeseen problems or circumstances which could cause a delay in the audit or any material expansion of the audit's scope. The Compliance Auditor shall be given full access to all records of the SFPUC and the Water and Hetch Hetchy Enterprises that the Auditor deems necessary for the audit.

C. Audit Procedures. The Compliance Auditor shall review San Francisco's calculation of the Wholesale Revenue Requirement and the underlying data in order to carry out the purpose of the audit described in Section 7.03.A and to issue the report described in Section 7.05. At a minimum, the Compliance Auditor shall address the following:

1. Water Enterprise Operating and Maintenance Expenses. The Compliance Auditor shall review Water Enterprise cost ledgers to determine whether the recorded operating and maintenance expenses fairly reflect the costs incurred, were recorded on a basis consistent with applicable Generally Accepted Accounting Principles, and were allocated to the Wholesale Customers as provided in this Agreement.

2. Water Enterprise Administrative and General Expenses. The Compliance Auditor shall review Water Enterprise cost ledgers and other appropriate financial records, including those of the SFPUC, to determine whether the recorded administrative and general expenses fairly reflect the costs incurred by or allocated to the Water Enterprise, whether they were recorded on a basis consistent with applicable Generally Accepted Accounting Principles, whether SFPUC charges were allocated to the Water Enterprise in accordance with this Agreement, and whether the amount of administrative and general expenses allocated to the Wholesale Customers was determined as provided by this Agreement.

3. Property Taxes. The Compliance Auditor shall review Water Enterprise cost ledgers to determine whether the amount of property taxes shown on the report fairly reflects the property tax expense incurred by San Francisco for Water Enterprise property outside of San Francisco and whether there has been deducted from the amount to be allocated (1) all taxes actually reimbursed to San Francisco by tenants of Water Enterprise property under leases that require such reimbursement and (2) any refunds received from the taxing authority. The Compliance Auditor also shall determine whether the amount of property taxes allocated to the Wholesale Customers was determined as provided in this Agreement.

4. Debt Service. The Compliance Auditor shall review SFPUC records to determine whether debt service, and associated coverage requirements, were allocated to the Wholesale Customers as provided in this Agreement.

5. Amortization of Existing Assets in Service as of June 30, 2009. The Compliance Auditor shall review both Water and Hetch Hetchy Enterprise records to determine whether the payoff amount for Existing Assets allocated to the Wholesale Customers as shown on Attachment K-1 through K-4 was calculated as provided in Section 5.03 of this Agreement.

6. Revenue-Funded Capital Appropriations/Expenditures. The Compliance Auditor shall review San Francisco's calculation of actual expenditures on the wholesale share of revenue-funded New Regional Assets and remaining unexpended and unencumbered project balances in the "Wholesale Capital Fund" described in Section 6.08, to determine whether the procedures contained in that section were followed.

7. Hetch Hetchy Expenses. The Compliance Auditor shall determine whether Hetch Hetchy Enterprise expenses were allocated to the Wholesale Customers as provided in this Agreement.

D. Use of and Reliance on Audited Financial Statements and Water Use Data

1. In performing the audit, the Compliance Auditor shall incorporate any adjustments to the cost ledgers recommended by the independent certified public accountant, referred to in Section 7.01.I, which audited the financial statements of the Water and Hetch Hetchy Enterprises. The Compliance Auditor may rely upon the work performed by that independent certified public accountant if the Compliance Auditor reviews the work and is willing to take responsibility for it as part of the compliance audit.

2. In performing the Compliance Audit and issuing its report, the Compliance Auditor may rely on water use data furnished by the Water Enterprise, regardless of whether the Wholesale Customers contest the accuracy of such data. The Compliance Auditor shall have no obligation to independently verify the accuracy of the water use data provided by San Francisco; however, the Compliance Auditor shall disclose in its report any information which came to its attention suggesting that the water use data provided by San Francisco are inaccurate in any significant respect.

E. Exit Conference. Upon completion of the audit, the Compliance Auditor shall meet with San Francisco and BAWSCA to discuss audit findings, including (1) any material weakness in internal controls and (2) adjustments proposed by the Compliance Auditor and San Francisco's response (i.e., booked or waived).

7.05 Issuance of Compliance Auditor's Report

A. San Francisco will require the Compliance Auditor to issue its report no later than nine months after the fiscal year under audit (i.e., March 31 of the following calendar year). The Compliance Auditor's report shall be addressed and delivered to San Francisco and BAWSCA. The report shall contain:

1. A statement that the Auditor has audited the report on the calculation of the Wholesale Revenue Requirement and changes in the balancing account, and supporting documents, prepared by San Francisco as required by Section 7.02.

2. A statement that the audit was conducted in accordance with auditing standards generally accepted in the United States of America, and that the audit provides a reasonable basis for its opinion.

3. A statement that in the Compliance Auditor's opinion the Wholesale Revenue Requirement was calculated by San Francisco in accordance with this Agreement and that the change in the balancing account shown in San Francisco's report was calculated as required by this Agreement and presents fairly, in all material respects, changes in and the balance due to (or from) the Wholesale Customers as of the end of the fiscal year under audit.

7.06 Wholesale Customer Review

A. One or more Wholesale Customers, or BAWSCA, may engage an independent certified public accountant (CPA) to conduct a review (at its or their expense) of San Francisco's calculation of the annual Wholesale Revenue Requirement and a review of changes in the balancing account.

B. If a Wholesale Customer or BAWSCA wishes such a review to be conducted it will provide written notice to SFPUC within 30 days of the date the Compliance Auditor's report is issued. The notice will identify the CPA or accounting/auditing firm that will conduct the review and the specific aspects of the Compliance Auditor's report that are the subject of the review. If more than one notice of review is received by the SFPUC, the requesting Wholesale Customers shall combine and coordinate their reviews and select a lead auditor to act on their behalf for the purposes of requesting documents and conducting on-site investigations.

C. San Francisco will cooperate with the CPA appointed by a Wholesale Customer or BAWSCA. This cooperation includes making requested records promptly available, making knowledgeable SFPUC personnel available to timely and truthfully answer the CPA's questions and directing the Compliance Auditor to cooperate with the CPA.

D. The Wholesale Customer's review shall be completed within 60 days after the date the Compliance Auditor's report is issued. At the conclusion of the review, representatives of San Francisco and BAWSCA shall meet to discuss any differences between them concerning San Francisco's compliance with Articles 5 or 6 of this Agreement during the preceding fiscal year or San Francisco's calculation of the Wholesale Revenue Requirement for the preceding fiscal year. If such differences cannot be resolved, the dispute shall be submitted to arbitration in accordance with Section 8.01.

Article 8. Other Agreements of the Parties

8.01 <u>Arbitration and Judicial Review</u>

A. **General Principles re Scope of Arbitration.** All questions or disputes arising under the following subject areas shall be subject to mandatory, binding arbitration and shall not be subject to judicial determination:

1. the determination of the Wholesale Revenue Requirement, which shall include both the calculations used in the determination and the variables used in those calculations;

2. the SFPUC's adherence to accounting practices and conduct of the Compliance Audit; and

3. the SFPUC's classification of new assets for purposes of determining the Wholesale Revenue Requirement.

All other questions or disputes arising under this Agreement shall be subject to judicial determination. Disputes about the scope of arbitrability shall be resolved by the courts.

B. **Demand for Arbitration**. If any arbitrable question or dispute should arise, any Wholesale Customer or the SFPUC may commence arbitration proceedings hereunder by service of a written Demand for Arbitration. Demands for arbitration shall set forth all of the issues to be arbitrated, the general contentions relating to those issues, and the relief sought by the party serving the Demand. Within 45 days after service of a Demand upon it, any Wholesale Customer or the SFPUC may serve a Notice of Election to become a party to the arbitration and a Response to the issues set forth in the Demand. The Response shall include the party's general contentions and defenses with respect to the claims made in the Demand, and may include any otherwise arbitrable claims, contentions and demands that concern the fiscal year covered by the Demand. If a timely Notice of Election and Response is not filed by any such entity, it shall not be a party to the arbitration but shall nonetheless be bound by the award of the arbitrator. If no party to this Agreement serves a timely Notice of Election and Response, the party seeking arbitration shall be entitled to the relief sought in its Demand for Arbitration without the necessity of further proceedings. Any claims not made in a Demand or Response shall be deemed waived.

If a Demand or Notice of Election is made by the SFPUC, it shall be served by personal delivery or certified mail to each Wholesale Customer at the address of such customer as set forth in the billing records of the SFPUC. If a Demand or Notice of Election is made by a Wholesale Customer, service shall be by certified mail or personal delivery to the General Manager, SFPUC, 1155 Market Street, 11th Floor, San Francisco, California 94103, and to each of the other Wholesale Customers. If arbitration is commenced, the Wholesale Customers shall use their best efforts to formulate a single, joint position with respect thereto. In any event, with respect to the appointment of arbitrators, as hereinafter provided, all Wholesale Customers that take the same position as to the issues to be arbitrated shall jointly and collectively be deemed to be a single party.

C. Limitations Period. All Demands For Arbitration shall be served within twelve months of receipt by BAWSCA of the Wholesale Revenue Requirement Compliance Auditor's Report for that year. If a party fails to file a Demand within the time period specified in this subsection, that party waives all present and future claims with respect to the fiscal year in question. If no such Demand is served within the twelve month period specified above, the SFPUC's determination of the Wholesale Revenue Requirement for that year shall be final and conclusive. Whether any particular claim is barred by the twelve month limitations period provided for herein shall be for the arbitrator to determine. Prior to the expiration of the twelve month limitations period, the parties to the dispute may agree by written stipulation to extend the period by up to six additional months.

The Arbitrator may order the alteration or recalculation of underlying Water Enterprise and/or Hetch Hetchy Enterprise accounts or asset classifications. Such changes shall be used to calculate the Wholesale Revenue Requirement for the fiscal year in dispute and shall also be used to determine future Wholesale Revenue Requirements, if otherwise applicable, even though the existing entries in such accounts or the asset classifications, in whole or in part, predate the twelve month period described above, so long as a timely arbitration Demand has been filed in accordance with this subsection.

D. Number and Appointment of Arbitrators. All arbitration proceedings under this section shall be conducted by a single arbitrator, selected by the SFPUC and a designated representative of the Wholesale Customers or each group of Wholesale Customers that take the same position with respect to the arbitration, within 75 days after service of the Demand. If the parties to the arbitration cannot agree on an arbitrator within 75 days, any party may petition the Marin County Superior Court for the appointment of an arbitrator pursuant to Code of Civil Procedure Section 1281.6 (or any successor provision).

E. <u>Guidelines for Qualifications of Arbitrators</u>. The Wholesale Customers and the SFPUC acknowledge that the qualifications of the arbitrator will vary with the nature of the matter arbitrated, but, in general, agree that such qualifications may include service as a judge or expertise in one or more of the following fields: public utility law, water utility rate setting, water system and hydraulic engineering, utility accounting methods and practices, and water system operation and management. The parties to the arbitration shall use their best efforts to agree in advance upon the qualifications of any arbitrator to be appointed by the Superior Court.

F. <u>Powers of Arbitrator; Conduct of Proceedings</u>

1. Except as provided in this section, arbitrations under this section shall be conducted under and be governed by the provisions of California Code of Civil Procedure Sections 1282.2 through 1284.2 (hereinafter, collectively, "Code sections"), and arbitrators appointed hereunder shall have the powers and duties specified by the Code sections.

2. Within the meaning of the Code sections, the term "neutral arbitrator" shall mean the single arbitrator selected by the parties to the arbitration.

3. Unless waived in writing by the parties to the arbitration, the notice of hearing served by the arbitrator shall not be less than 90 days.

4. The lists of witnesses (including expert witnesses), and the lists of documents (including the reports of expert witnesses) referred to in Code of Civil Procedure Section 1282.2 shall be mutually exchanged, without necessity of demand therefore, no later than 60 days prior to the date of the hearing, unless otherwise agreed in writing by the parties to the arbitration. Upon application of any party, or on his or her own motion, the arbitrator may schedule one or more prehearing conferences for the purposes of narrowing and/or expediting resolution of the issues in dispute. Strict conformity to the rules of evidence is not required, except that the arbitrator shall apply applicable law relating to privileges and work product. The arbitrator shall consider evidence that he or she finds relevant and material to the dispute, giving the evidence such weight as is appropriate. The arbitrator may limit testimony to exclude evidence that would be immaterial or unduly repetitive, provided that all parties are afforded the opportunity to present material and relevant evidence.

5. Within thirty days after the close of the arbitration hearing, or such other time as the arbitrator shall determine, the parties will submit proposed findings and a proposed remedy to the arbitrator. The parties may file objections to their adversary's proposed findings and remedy within a time limit to be specified by the arbitrator. The arbitrator shall not base his or her award on information not obtained at the hearing.

6. The arbitrator shall render a written award no later than twelve months after the arbitrator is appointed, either by the parties or by the court, provided that such time may be waived or extended as provided in Code of Civil Procedure Section 1283.8.

7. The provisions for discovery set forth in Code of Civil Procedure Section 1283.05 are incorporated into and made part of this Agreement, except that: (a) leave of the arbitrator need not be obtained for the taking of depositions, including the depositions of expert witnesses; (b) the provisions of Code of Civil Procedure Section 2034.010 et seq., relating to discovery of expert witnesses, shall automatically be applicable to arbitration proceedings arising under this Agreement without the necessity for a formal demand pursuant to Section 2034.210 and the date for the exchange of expert discovery provided by Sections 2034.260 and 2034.270 shall be not later than 60 days prior to the date for the hearing; and (c) all reports, documents, and other materials prepared or reviewed by any expert designated to testify at the arbitration shall be discoverable. In appropriate circumstances, the arbitrator may order any party to this Agreement that is not a party to the arbitration to comply with any discovery request.

8. For the purposes of allocation of expenses and fees, as provided in Code of Civil Procedure Section 1284.2, if any two or more Wholesale Customers join together in a single, joint position in the arbitration, those Wholesale Customers shall be deemed to be a single party. If any Wholesale Customer or customers join together with the SFPUC in a single joint position in the arbitration, those Wholesale Customers and the SFPUC together shall be deemed to be a single party.

9. Subject to any other limitations imposed by the Agreement, the arbitrator shall have power to issue orders mandating compliance with the terms of the Agreement or enjoining violations of the Agreement. With respect to any arbitration brought to redress a claimed wholesale overpayment to the SFPUC, the arbitrator's power to award monetary relief

shall be limited to entering an order requiring that an adjustment be made in the amount posted to the balancing account for the fiscal year covered by the Demand.

10. All awards of the arbitrator shall be binding on the SFPUC and the Wholesale Customers regardless of the participation or lack thereof by any Wholesale Customer or the SFPUC as a party to the arbitration proceeding. The parties to an arbitration shall have the power to modify or amend any arbitration award by mutual consent. The arbitrator shall apply California law.

8.02 Attorneys' Fees

A. Arbitration or Litigation Between San Francisco and Wholesale Customers Arising under the Agreement or Individual Water Sales Contracts. Each party will bear its own costs, including attorneys' fees, incurred in any arbitration or litigation arising under this Agreement or the Individual Water Sales Contracts between San Francisco and the Wholesale Customers. Notwithstanding the foregoing, and subject to the limitations contained herein, the SFPUC may allocate to the Wholesale Customers as an allowable expense, utilizing the composite rate used for allocating other Water Enterprise administrative and general expenses, any attorneys' fees and costs incurred by the SFPUC in connection with arbitration and/or litigation arising under this Agreement and/or the Individual Water Sales Contracts. Attorneys' fees incurred by the SFPUC for attorneys employed in the San Francisco City Attorney's office shall be billed at the hourly rates charged for the attorneys in question by the San Francisco City Attorney's Office to the SFPUC. Attorneys' fees incurred by the SFPUC for attorneys other than those employed in the San Francisco City Attorney's Office shall be limited to the hourly rates charged to the SFPUC for attorneys and paralegals with comparable experience employed in the San Francisco City Attorney's office and in no event shall exceed the highest hourly rate charged by any attorney or paralegal employed in the City Attorney's Office to the SFPUC.

B. Arbitration or Litigation Outside of Agreement Concerning the SFPUC Water System or Reserved Issues

1. The attorneys' fees and costs incurred by the SFPUC in litigation between San Francisco and one or more of the Wholesale Customers arising from matters outside of the Agreement, including, without limitation, litigation and/or arbitration concerning the issues specifically reserved in the Agreement, shall be allocated between the Retail Customers and the

Wholesale Customers utilizing the composite rate used for allocating other Water Enterprise administrative and general expenses.

2. If, in any litigation described in subsection B.1 above, attorneys' fees and costs are awarded to one or more of the Wholesale Customers as prevailing parties, the SFPUC's payment of the Wholesale Customers' attorneys' fees and costs shall not be an allowable expense pursuant to subsection A.

3. If, in any litigation described in subsection B.1, the SFPUC obtains an award of attorneys' fees and costs as a prevailing party against one or more of the Wholesale Customers, any such award shall be reduced to offset the amount of the SFPUC's fees and costs, if any, that have already been paid by the Wholesale Customers in the current or any prior fiscal years pursuant to subsection B.1 and the provisions of Articles 5 and 6 of the Agreement.

4. Nothing contained in this Agreement, including this subsection, shall authorize a court to award attorneys' fees and costs to a prevailing party as a matter of contract and/or the provisions of Civil Code Section 1717, in litigation between San Francisco and one or more of the Wholesale Customers arising from matters outside of the Agreement, including, without limitation, litigation and/or arbitration concerning the issues specifically reserved in the Agreement.

C. Attorneys Fees and Costs Incurred by the SFPUC in Connection with the Operation and Maintenance of the SFPUC Water Supply System. All attorneys' fees and costs incurred by the SFPUC in connection with the operation and maintenance of the SFPUC's water supply system shall be allocated between Retail Customers and the Wholesale Customers utilizing the composite rate used for allocating other Water Enterprise administrative and general expenses.

8.03 Annual Meeting and Report

A. The parties wish to ensure that the Wholesale Customers may, in an orderly way, be informed of matters affecting the Regional Water System, including matters affecting the continuity and adequacy of their water supply from San Francisco.

For this purpose, the General Manager of the SFPUC shall meet annually with the Wholesale Customers and BAWSCA during the month of February, commencing

February 2010. At these annual meetings, the SFPUC shall provide the Wholesale Customers a report on the following topics:

1. Capital additions under construction or being planned for the Regional Water System, including the status of planning studies, financing plans, environmental reviews, permit applications, etc.;

2. Water use trends and projections for Retail Customers and Wholesale Customers;

3. Water supply conditions and projections;

4. The status of any administrative proceedings or litigation affecting San Francisco's water rights or the SFPUC's ability to deliver water from the watersheds which currently supply the Regional Water System;

5. Existing or anticipated problems with the maintenance and repair of the Regional Water System or with water quality;

6. Projections of Wholesale Revenue Requirements for the next five years;

7. Any other topic which the SFPUC General Manager places on the agenda for the meeting;

8. Any topic which the Wholesale Customers, through BAWSCA, request be placed on the agenda, provided that the SFPUC is notified of the request at least 10 days before the meeting.

B. The General Manager of the SFPUC, the Assistant General Manager of the Water Enterprise, and the Assistant General Manager of Business Services-CFO will use their best efforts to attend the annual meetings. If one or more of these officers are unable to attend, they will designate an appropriately informed assistant to attend in their place.

8.04 Administrative Matters Delegated to BAWSCA

A. The Wholesale Customers hereby delegate the authority and responsibility for performing the following administrative functions contemplated in this Agreement to BAWSCA:

1. Approval of calculations of Proportional Annual Water Use required by Section 3.14 and Attachment J, "Water Use Measurement and Tabulation";

2. Approval of amendments to Attachments J and K-3 and K-4, "25-Year Payoff Schedules for Existing Rate Base";

3. Agreement that the Water Meter and Calibration Procedures Manual to be prepared by the SFPUC may supersede some or all of the requirements in Attachment J, as described in Section 3.14;

4. Conduct of Wholesale Customer review of SFPUC's calculation of annual Wholesale Revenue Requirement/Change in Balancing Account described in Section 7.06;

5. Approval of an adjustment to Wholesale Revenue Coverage as described in Section 6.06.

B. A majority of the Wholesale Customers may, without amending this Agreement, delegate additional administrative functions to BAWSCA. To be effective, such expanded delegation must be evidenced by resolutions adopted by the governing bodies of a majority of the Wholesale Customers.

C. Unless otherwise explicitly stated, the administrative authority delegated to BAWSCA may be exercised by the General Manager/CEO of BAWSCA, rather than requiring action by the BAWSCA Board of Directors. In addition, the Wholesale Customers may, with the consent of BAWSCA, delegate to BAWSCA the initiation, defense, and settlement of arbitration proceedings provided for in Section 8.01.

8.05 <u>Preservation of Water Rights; Notice of Water Rights Proceedings</u>

A. It is the intention of San Francisco to preserve all of its water rights, irrespective of whether the water held under such water rights is allocated under this Agreement. Nothing in this Agreement shall be construed as an abandonment, or evidence of an intent to abandon, any of the water rights that San Francisco presently possesses.

B. San Francisco shall use its best efforts to give prompt notice to BAWSCA of any litigation or administrative proceedings to which San Francisco is a party involving water rights to the Regional Water System. The failure of San Francisco to provide notice as required by this section, for whatever reason, shall not give rise to any monetary liability.

8.06 SFPUC Rules and Regulations

The sale and delivery of all water under this Agreement shall be subject to such of the "Rules and Regulations Governing Water Service to Customers" of the Water Enterprise adopted by the Commission, as those rules and regulations may be amended from time to time, as are (1) applicable to the sale and delivery of water to the Wholesale Customers, (2) reasonable, and (3) not inconsistent with either this Agreement or with an Individual Water Sales Contract. The SFPUC will give the Wholesale Customers notice of any proposal to amend the Rules and Regulations in a manner that would affect the Wholesale Customers. The notice will be delivered at least thirty days in advance of the date on which the proposal is to be considered by the Commission and will be accompanied by the text of the proposed amendment.

8.07 Reservations of, and Limitations on, Claims

A. General Reservation of Raker Act Contentions. The 1984 Agreement resolved a civil action brought against San Francisco by certain of the Wholesale Customers. Plaintiffs in that action contended that they, and other Wholesale Customers that are municipalities or special districts, were "co-grantees" within the meaning of Section 8 of the Act and were entitled to certain rights, benefits and privileges by virtue of that status. San Francisco disputed those claims.

Nothing in this Agreement, or in the Individual Water Sales Contracts, shall be construed or interpreted in any way to affect the ultimate resolution of the controversy between the parties concerning whether any of the Wholesale Customers are "co-grantees" under the Act and, if so, what rights, benefits and privileges accrue to them by reason of that claimed status.

B. Claims Reserved but not Assertable During Term or Portions Thereof. The following claims, which San Francisco disputes, are reserved but may not be asserted during the Term (or portions thereof, as indicated):

1. The Wholesale Customers' claim that the Act entitles them to water at cost.

2. The Wholesale Customers' claim that San Francisco is obligated under the Act or state law to supply them with additional water in excess of the Supply Assurance. This claim may not be asserted unless and until San Francisco decides not to meet projected

water demands of Wholesale Customers in excess of the Supply Assurance pursuant to Section 4.06.

3. The claim by San Jose and Santa Clara that they are entitled under the Act, or any other federal or state law, to permanent, non-interruptible status and to be charged rates identical to those charged other Wholesale Customers. This claim may not be asserted unless and until San Francisco notifies San Jose or Santa Clara that it intends to interrupt or terminate water deliveries pursuant to Section 4.05.

4. The Wholesale Customers' claim that the SFPUC is not entitled to impose a surcharge for lost power generation revenues attributable to furnishing water in excess of the Supply Assurance. This claim may not be asserted unless and until SFPUC furnishes water in excess of the Supply Assurance during the Term and also includes such a surcharge in the price of such water.

5. Claims by Wholesale Customers (other than San Jose and Santa Clara, whose service areas are fixed) that SFPUC is obligated under the Act or state law to furnish water, within their Individual Supply Guarantee, for delivery to customers outside their existing service area and that Wholesale Customers are entitled to enlarge their service areas to supply those customers. Such claims may be asserted only after compliance with the procedure set forth in Section 3.03, followed by SFPUC's denial of, or failure for six months to act on, a written request by a Wholesale Customer to expand its service area.

C. <u>Waived Activities</u>. The Wholesale Customers (and the SFPUC, where specified) will refrain from the following activities during the Term (or portions thereof, as specified):

1. The Wholesale Customers and the SFPUC will not contend before any court, administrative agency or legislative body or committee that the methodology for determining the Wholesale Revenue Requirement (or the requirements for (a) amortization of the ending balance under the 1984 Agreement, or (b) contribution to the Wholesale Revenue Coverage) determined in accordance with this Agreement violates the Act or any other provision of federal law, state law, or San Francisco's City Charter, or is unfair, unreasonable or unlawful.

2. The Wholesale Customers will not challenge the transfer of funds by the SFPUC to any other San Francisco City department or fund, provided such transfer complies with the San Francisco City Charter. The transfer of its funds, whether or not permitted by the

City Charter, will not excuse the SFPUC from its failure to perform any obligation imposed by this Agreement.

3. The Wholesale Customers and the SFPUC will not assert monetary claims against one another based on the 1984 Agreement other than otherwise arbitrable claims arising from the three fiscal years immediately preceding the start of the Term (i.e., FYs 2006-07, 2007-08 and 2008-09). Such claims, if any, shall be governed by the dispute resolution provisions of this Agreement, except that the time within which arbitration must be commenced shall be 18 months from delivery of the Compliance Auditor's report.

D. Other

1. This Agreement shall determine the respective monetary rights and obligations of the parties with respect to water sold by the SFPUC to the Wholesale Customers during the Term. Such rights and obligations shall not be affected by any judgments or orders issued by any court in litigation, whether or not between parties hereto, and whether or not related to the controversy over co-grantee status, except for arbitration and/or litigation expressly permitted in this Agreement. No judicial or other resolution of issues reserved by this section will affect the Wholesale Revenue Requirement which, during the Term, will be determined exclusively as provided in Articles 5, 6 and 7 of this Agreement.

2. Because delays in the budget process or other events may cause the SFPUC to defer the effective date of changes in wholesale rates until after the beginning of the fiscal year, this Agreement does not require the SFPUC to make changes in wholesale rates effective at the start of the fiscal year or at any other specific date.

3. The Wholesale Customers do not, by executing this Agreement, concede the legality of the SFPUC's establishing Interim Supply Allocations, as provided in Article 4 or imposing Environmental Enhancement Surcharges on water use in excess of such allocations. Any Wholesale Customer may challenge such allocation when imposed and/or such surcharges if and when levied, in any court of competent jurisdiction.

4. The furnishing of water in excess of the Supply Assurance by San Francisco to the Wholesale Customers shall not be deemed or construed to be a waiver by San Francisco of its claim that it has no obligation under any provision of law to supply such water to the Wholesale Customers, nor shall it constitute a dedication by San Francisco to the Wholesale Customers of such water.

8.08 <u>Prohibition of Assignment</u>

A. This Agreement shall be binding on, and shall inure to the benefit of, the parties and their respective successors and permitted assigns. Each Wholesale Customer agrees that it will not transfer or assign any rights or privileges under this Agreement, either in whole or in part, or make any transfer of all or any part of its water system or allow the use thereof in any manner whereby any provision of this Agreement will not continue to be binding on it, its assignee or transferee, or such user of the system. Any assignment or transfer in violation of this covenant, and any assignment or transfer that would result in the supply of water in violation of the Act, shall be void.

B. Nothing in this section shall prevent any Wholesale Customer (except the California Water Service Company and Stanford) from entering into a joint powers agreement or a municipal or multi-party water district with any other Wholesale Customer (except the two listed above) to exercise the rights and obligations granted to and imposed upon the Wholesale Customers hereunder, nor shall this section prevent any Wholesale Customer (except the two listed above) from succeeding to the rights and obligations of another Wholesale Customer hereunder as long as the Wholesale Service Area served by the Wholesale Customers involved in the succession is not thereby enlarged.

8.09 <u>Notices</u>

A. All notices and other documents that San Francisco is required or permitted to send to the Wholesale Customers under this Agreement shall be sent to each and all of the Wholesale Customers by United States mail, first class postage prepaid, addressed to each Wholesale Customer at the address to which monthly water bills are mailed by the Water Enterprise.

B. All notices or other documents which the Wholesale Customers are required or permitted to send to San Francisco under this Agreement shall be sent by United States mail, first class postage prepaid, addressed as follows:

General Manager
San Francisco Public Utilities Commission
1155 Market Street, 11th Floor
San Francisco, CA 94103

C. Each Wholesale Customer is a member of BAWSCA. San Francisco shall send a copy of each notice or other document which it is required to send to all Wholesale Customers to BAWSCA addressed as follows:

General Manager/CEO
Bay Area Water Supply and Conservation Agency
155 Bovet Road, Suite 302
San Mateo, CA 94402

The failure of San Francisco to send a copy of such notices or documents to BAWSCA shall not invalidate any rate set or other action taken by San Francisco.

D. Any party (or BAWSCA) may change the address to which notice is to be sent to it under this Agreement by notice to San Francisco (in the case of a change desired by a Wholesale Customer or BAWSCA) and to the Wholesale Customer and BAWSCA (in the case of a change desired by San Francisco).

The requirements for notice set forth in Section 8.01 concerning arbitration shall prevail over this section, when they are applicable.

8.10 Incorporation of Attachments

Attachments A through Q, referred to herein, are incorporated in and made a part of this Agreement.

8.11 Interpretation

In interpreting this Agreement, or any provision thereof, it shall be deemed to have been drafted by all signatories, and no presumption pursuant to Civil Code Section 1654 may be invoked to determine the Agreement's meaning. The marginal headings and titles to the sections and paragraphs of this Agreement are not a part of this Agreement and shall have no effect upon the construction or interpretation of any part hereof.

8.12 Actions and Approvals by San Francisco

Whenever action or approval by San Francisco is required or contemplated by this Agreement, authority to act or approve shall be exercised by the Commission, except if such action is required by law to be taken, or approval required to be given, by the San Francisco Board of Supervisors. The Commission may delegate authority to the General Manager in accordance with the San Francisco City Charter and Administrative Code, except for actions that this Agreement requires to be taken by the Commission.

8.13 Counterparts

Execution of this Agreement may be accomplished by execution of separate counterparts by each signatory. San Francisco shall deliver its executed counterpart to BAWSCA and the counterpart which each Wholesale Customer executes shall be delivered to San Francisco. The separate executed counterparts, taken together, shall constitute a single agreement.

8.14 Limitations on Damages

A. Unless otherwise prohibited by this Agreement, general or direct damages may be recovered for a breach of a party's obligations under this Agreement. No party is liable for, or may recover from any other party, special, indirect or consequential damages or incidental damages, including, but not limited to, lost profits or revenue. No damages may be awarded for a breach of Section 8.17.

B. The limitations in subsection A apply only to claims for damages for an alleged breach of this Agreement. These limitations do not apply to claims for damages for an alleged breach of a legal duty that arises independently of this Agreement, established by constitution or statute.

C. If damages would be an inadequate remedy for a breach of this Agreement, equitable relief may be awarded by a court in a case in which it is otherwise proper.

D. This section does not apply to any claim of breach for which arbitration is the exclusive remedy pursuant to Section 8.01.A.

8.15 Force Majeure

A. Excuse from Performance. No party shall be liable in damages to any other party for delay in performance of, or failure to perform, its obligations under this Agreement, including the obligations set forth in Sections 3.09 and 4.06, if such delay or failure is caused by a "Force Majeure Event."

B. Notice. The party claiming excuse shall deliver to the other parties a written notice of intent to claim excuse from performance under this Agreement by reason of a Force

Majeure Event. Notice required by this section shall be given promptly in light of the circumstances, and, in the case of events described in (c), (d) or (e) of the definition of Force Majeure Event only, not later than ten (10) days after the occurrence of the Force Majeure Event. Such notice shall describe the Force Majeure Event, the services impacted by the claimed event, the length of time that the party expects to be prevented from performing, and the steps which the party intends to take to restore its ability to perform.

C. **Obligation to Restore Ability to Perform**. Any suspension of performance by a party pursuant to this section shall be only to the extent, and for a period of no longer duration than, required by the nature of the Force Majeure Event, and the party claiming excuse shall use its best efforts to remedy its inability to perform as quickly as possible.

8.16 No Third-Party Beneficiaries

This Agreement is exclusively for the benefit of the parties and not for the benefit of any other Person. There are no third-party beneficiaries of this Agreement and no person not a party shall have any rights under or interests in this Agreement.

No party may assert a claim for damages on behalf of a person other than itself, including a person that is not a party.

8.17 Good Faith and Fair Dealing

San Francisco and the Wholesale Customers each acknowledge their obligation under California law to act in good faith toward, and deal fairly with, each other with respect to this Agreement.

Article 9. Implementation and Special Provisions Affecting Certain Wholesale Customers

9.01 General; Individual Water Sales Contracts

A. As described in Section 1.03, San Francisco previously entered into Individual Water Sales Contracts with each of the Wholesale Customers. The term of the majority of Individual Water Sales Contracts will expire on June 30, 2009, concurrently with the expiration of the 1984 Agreement. Except as provided below in this Article, each of the Wholesale Customers will execute a new Individual Water Sales Contract with San Francisco concurrently with its approval of the Agreement.

B. The Individual Water Sales Contracts will describe the service area of each Wholesale Customer, identify the location and size of connections between the Regional Water System and the Wholesale Customer's distribution system, provide for periodic rendering and payment of bills for water usage, and in some instances contain additional specialized provisions unique to the particular Wholesale Customer and not of general concern or applicability. A sample Individual Water Sales Contract is provided at Attachment F. The Individual Water Sales Contracts between San Francisco and the Wholesale Customers will not contain any provision inconsistent with Articles 1 through 8 of this Agreement except (1) as provided below in this Article or (2) to the extent that such provisions are not in derogation of the Fundamental Rights of other Wholesale Customers under this Agreement. Any provisions in an Individual Water Sales Contract which are in violation of this section shall be void.

9.02 California Water Service Company

A. The parties recognize that the California Water Service Company is an investor-owned utility company and, as such, has no claim to co-grantee status under the Act, which specifically bars private parties from receiving for resale any water produced by the Hetch Hetchy portion of the Regional Water System. Accordingly, the following provisions shall apply to the California Water Service Company, notwithstanding anything to the contrary elsewhere in this Agreement.

B. The total quantity of water delivered by San Francisco to the California Water Service Company shall not in any calendar year exceed 47,400 acre feet, which is the estimated average annual production of Local System Water. If San Francisco develops additional Local System Water after the Effective Date, it may (1) increase the maximum delivery amount stated herein; and (2) increase the Supply Assurance, but not necessarily both. San Francisco has no obligation to deliver water to California Water Service Company in excess of the maximum stated herein, except as such maximum may be increased by San Francisco pursuant to this subsection. The maximum annual quantity of Local System Water set forth in this subsection is intended to be a limitation on the total quantity of water that may be allocated to California Water Service Company, and is not an Individual Supply Guarantee for purposes of Section 3.02. The maximum quantity of Local System Water set forth in this subsection is subject to reduction in response to (1) changes in long-term hydrology or (2) environmental water requirements that may be imposed by or negotiated with state and federal resource agencies in order to comply with state or federal law or to secure applicable permits for construction of Regional Water System facilities. San Francisco shall notify California Water Service Company of any anticipated reduction of the quantity of Local System Water set forth in this subsection, along with an explanation of the basis for the reduction.

C. Notwithstanding anything in Section 8.08 to the contrary, California Water Service Company shall have the right to assign to a public agency having the power of eminent domain all or a portion of the rights of California Water Service Company under any contract between it and San Francisco applicable to any individual district of California Water Service Company in connection with the acquisition by such public agency of all or a portion of the water system of California Water Service Company in such district. In the event of any such assignment of all the rights, privileges and obligations of California Water Service Company under such contract, California Water Service Company shall be relieved of all further obligations under such contract provided that the assignee public agency expressly assumes the obligations of California Water Service Company thereunder. In the event of such an assignment of a portion of the rights, privileges and obligations of California Water Service Company under such contract, California Water Service Company shall be relieved of such portion of such obligations so assigned thereunder provided that the assignee public agency shall expressly assume such obligations so assigned to it.

D. Should California Water Service Company seek to take over or otherwise acquire, in whole or in part, the service obligations of another Wholesale Customer under Section 3.03.E, it will so inform San Francisco at least six months prior to the effective date of the sale and provide information concerning the total additional demand proposed to be served, in order that San Francisco may compare the proposed additional demand to the then-current estimate of Local System Water. In this regard, California Water Service Company has notified the SFPUC that it has reached an agreement to acquire the assets of Skyline County Water District ("Skyline") and assume the responsibility for providing water service to customers in the Skyline service area. California Water Service Company has advised the SFPUC that, on September 18, 2008, the California Public Utilities Commission approved California Water Service Company's acquisition of Skyline. The SFPUC anticipates approving the transfer of Skyline's Supply Guarantee as shown on Attachment C to California Water Service Company and the expansion of California Water Service Company's service area to include the current Skyline service area before the Effective Date of this Agreement. All parties to this Agreement authorize corresponding modifications of Attachment C, as well as any of the Agreement's other provisions, to reflect the foregoing transaction without the necessity of amending this Agreement.

E. Nothing in this Agreement shall preclude San Francisco from selling water to any county, city, town, district, political subdivision, or other public agency for resale to customers within the service area of the California Water Service Company. Nothing in this Agreement shall require or contemplate any delivery of water to California Water Service Company in violation of the Act.

F. Nothing in this Agreement shall alter, amend or modify the Findings of Fact and Conclusions of Law and the Judgment dated May 25, 1961, in that certain action entitled *City and County of San Francisco v. California Water Service Company* in the Superior Court of the State of California in and for the County of Marin, No. 23286, as modified by the Quitclaim Deed from California Water Service Company to San Francisco dated August 22, 1961. The rights and obligations of San Francisco and California Water Service Company under these documents shall continue as therein set forth.

9.03 <u>City of Hayward</u>

A. San Francisco and the City of Hayward ("Hayward") entered into a water supply contract on February 9, 1962 ("the 1962 contract") which provides, *inter alia*, that San Francisco will supply Hayward with all water supplemental to sources and supplies of water owned or controlled by Hayward as of that date, in sufficient quantity to supply the total water needs of the service area described on an exhibit to the 1962 contract "on a permanent basis." The service area map attached as Exhibit C to the 1962 contract was amended in 1974 to remove an area of land in the Hayward hills and in 2008 to make minor boundary adjustments identified in SFPUC Resolution No. 08-0035.

B. The intention of the parties is to continue the 1962 contract, as amended, in effect as the Individual Water Sales Contract between San Francisco and Hayward. Accordingly, it shall not be necessary for San Francisco and Hayward to enter into a new Individual Water Sales Contract pursuant to this Article and approval of this Agreement by Hayward shall constitute approval of both this Agreement and an Individual Water Sales Contract for purposes of Section 1.03. The 1962 contract, as amended, will continue to describe the service area of Hayward, while rates for water delivered to Hayward during the Term shall be governed by Article 5 hereof. The 1962 contract, as amended, will continue in force after the expiration of the Term.

9.04 Estero Municipal Improvement District

A. San Francisco and the Estero Municipal Improvement District ("Estero") entered into a water supply contract on August 24, 1961, the term of which continues until August 24, 2011 ("the 1961 Contract"). The 1961 Contract provides, *inter alia*, that San Francisco will supply Estero with all water supplemental to sources and supplies of water owned or controlled by Estero as of that date, in sufficient quantity to supply the total water needs of the service area described on an exhibit to the 1961 Contract.

B. The intention of the parties is to terminate the 1961 Contract and replace it with a new Individual Water Sales Contract which will become effective on July 1, 2009. The new Individual Water Sales Contract will describe the current service area of Estero. The Individual Supply Guarantee applicable to Estero shall be 5.9 MGD, rather than being determined as provided in the 1961 Contract.

9.05 Stanford University

A. The parties recognize that The Board of Trustees of The Leland Stanford Junior University ("Stanford") operates a non-profit university, and purchases water from San Francisco for redistribution to the academic and related facilities and activities of the university and to residents of Stanford, the majority of whom are either employed by or students of Stanford. Stanford agrees that all water furnished by San Francisco shall be used by Stanford only for domestic purposes and those directly connected with the academic and related facilities and activities of Stanford, and no water furnished by San Francisco shall be used in any area now or hereafter leased or otherwise used for industrial purposes or for commercial purposes other than those campus support facilities that provide direct services to Stanford faculty, students or staff such as the U.S. Post Office, the bookstore and Student Union.

Nothing in this Agreement shall preclude San Francisco from selling water to any county, city, town, political subdivision or other public agency for resale to Stanford or to customers within the service area of Stanford.

B. Notwithstanding anything in Section 8.08 to the contrary, Stanford shall have the right to assign to a public agency having the power of eminent domain all or a portion of the rights of Stanford under this Agreement or the Individual Water Sales Contract between it and San Francisco in connection with the acquisition by such public agency of all or a portion of Stanford's water system. In the event of any such assignment of all the rights, privileges, and obligations of Stanford under such contract, Stanford shall be relieved of all further obligations under such contract, provided that the assignee public agency expressly assumes Stanford's obligations thereunder. In the event of such an assignment of a portion of the rights, privileges, and obligations of Stanford under such contract, Stanford shall be relieved of such obligations so assigned thereunder, provided that the assignee public agency shall expressly assume such obligations so assigned to it.

Nothing in this Agreement shall require or contemplate any delivery of water to Stanford in violation of the Act.

9.06 <u>City of San Jose and City of Santa Clara</u>

A. <u>Continued Supply on Temporary, Interruptible Basis</u>. During the term of the 1984 Agreement, San Francisco provided water to the City of San Jose ("San Jose") and the City of Santa Clara ("Santa Clara") on a temporary, interruptible basis pursuant to SFPUC Resolution No. 85-0256. Subject to termination or reduction of supply as provided in Section 4.05 of this Agreement, San Francisco will continue to supply water to San Jose and Santa Clara on a temporary, interruptible basis pending a decision by the Commission, pursuant to Section 4.05.H, as to whether to make San Jose and Santa Clara permanent customers of the Regional Water System. San Francisco will furnish water to San Jose and Santa Clara at the same rates as those applicable to other Wholesale Customers pursuant to this Agreement. Water delivered to San Jose and Santa Clara after July 1, 2009 may be limited by the SFPUC's ability to meet the full needs of all its other Retail and Wholesale Customers. The service areas of San Jose and Santa Clara set forth in their Individual Water Sales Contracts may not be expanded using the procedure set forth in Section 3.03. The combined annual average water usage of San Jose and Santa Clara shall not exceed 9 MGD. The allocation of that total amount between San Jose and Santa Clara shall be as set forth in their Individual Water Sales Contracts.

B. **Reservation of Rights.** In signing this Agreement, neither San Jose nor Santa Clara waives any of its rights to contend, in the event that San Francisco (1) elects to terminate or interrupt water deliveries to either or both of the two cities prior to 2018 using the process set forth in Section 4.05, or (2) does not elect to take either city on as a permanent customer in 2018, that it is entitled to permanent customer status, pursuant to the Act or any other federal or state law. In signing this Agreement, San Francisco does not waive its right to deny any or all such contentions.

9.07 City of Brisbane, Guadalupe Valley Municipal Improvement District, Town of Hillsborough

A. The parties acknowledge that San Francisco has heretofore provided certain quantities of water to the City of Brisbane ("Brisbane"), Guadalupe Valley Municipal Improvement District ("Guadalupe") and the Town of Hillsborough ("Hillsborough") at specified rates or without charge pursuant to obligations arising out of agreements between the predecessors of San Francisco and these parties, which agreements are referred to in judicial orders, resolutions of the SFPUC and/or the 1960 contracts between San Francisco and Brisbane, Guadalupe and Hillsborough. The parties intend to continue those arrangements and accordingly agree as follows:

1. Nothing in this Agreement is intended to alter, amend or modify the terms of SFPUC Resolution No. 74-0653 or the indenture of July 18, 1908 between the Guadalupe Development Company and the Spring Valley Water Company.

2. Nothing in this Agreement is intended to alter, amend or modify the Findings of Fact and Conclusions of Law and Judgment dated May 25, 1961 in that certain action entitled *City and County of San Francisco v. Town of Hillsborough* in the Superior Court of the State of California in and for the County of Marin, No. 23282, as modified by the Satisfaction of Judgment filed October 23, 1961 and the Compromise and Release between Hillsborough and San Francisco dated August 22, 1961. The rights and obligations of Hillsborough under these documents shall continue as therein set forth.

3. Nothing in this Agreement is intended to affect or prejudice any claims, rights or remedies of Guadalupe or of Crocker Estate Company, a corporation, or of Crocker

Land Company, a corporation, or of San Francisco, or of their successors and assigns, respectively, with respect to or arising out of that certain deed dated May 22, 1884, from Charles Crocker to Spring Valley Water Works, a corporation, recorded on May 24, 1884, in Book 37 of Deeds at page 356, Records of San Mateo County, California, as amended by that certain Deed of Exchange of Easements in Real Property and Agreement for Trade in Connection Therewith, dated July 29, 1954, recorded on August 4, 1954, in Book 2628, at page 298, Official Records of said San Mateo County, or with respect to or arising out of that certain action involving the validity or enforceability of certain provisions of said deed entitled *City and County of San Francisco v. Crocker Estate Company*, in the Superior Court of the State of California in and for the County of Marin, No. 23281.

IN WITNESS WHEREOF the parties have executed this Agreement by their duly authorized officers.

CITY AND COUNTY OF SAN FRANCISCO
Acting by and through its Public Utilities Commission

By:______________________________
Edward Harrington
General Manager

Date: ________________________, 2009

Approved by Commission Resolution No. 09-0069,
adopted April 28, 2009

____
Michael Housh
Secretary to Commission

Approved as to form:

DENNIS J. HERRERA
City Attorney

By:______________________________
Joshua D. Milstein
Deputy City Attorney

Attachment A - Definitions

"1984 Agreement" refers to the 1984 Settlement Agreement and Master Water Sales Contract between the City and County of San Francisco and certain Suburban Purchasers in San Mateo County, Santa Clara County and Alameda County, which expires on June 30, 2009.

"Act" refers to the Raker Act, 38 Stat. 242, the Act of Congress, enacted in 1913, that authorized the construction of the Hetch Hetchy system on federal lands.

"Adjusted Proportional Annual Use" means the respective percentages of annual water use, as adjusted to reflect deliveries of water by the Hetch Hetchy Enterprise to outside City Retail Customers. The adjustment is calculated each year as described in Section B of Attachment J and is shown on lines 18 and 19 of Table 1 of that Attachment.

"Agreement" refers to this Water Supply Agreement, by and among San Francisco and the Wholesale Customers who approve this Agreement in accordance with Section 1.03.

"BAWSCA" refers to the Bay Area Water Supply and Conservation Agency established pursuant to Division 31 of the California Water Code (Water Code §§81300-81461) or its successor and permitted assigns.

"CEQA" refers to the California Environmental Quality Act found at §§21000 et seq. of the Public Resources Code and the Guidelines for the California Environmental Quality Act found at §§15000 et seq. of Title 14 of the California Code of Regulations, as amended from time to time.

"Commission" means the governing board of the SFPUC, whose members, as of the date of this Agreement, are appointed by the Mayor of San Francisco and confirmed by the San Francisco Board of Supervisors.

"Compliance Audit" refers to the annual audit of the Wholesale Revenue Requirement by the Compliance Auditor required by Sections 7.03 through 7.05.

"Compliance Auditor" refers to the independent certified public accountant chosen by the San Francisco Controller to conduct each fiscal year's audit of the SFPUC's calculation of the Wholesale Revenue Requirement as provided in Section 7.03.B.

“Countywide Cost Allocation Plan” refers to the full costs of the Water and Hetch Hetchy Enterprises’ prorated share of San Francisco city government expenses that are not directly billed to city departments, as determined by the Controller of the City and County of San Francisco.

“Debt Service” means principal and interest paid during a fiscal year on Indebtedness incurred by the SFPUC for the 2006 Revenue Bonds, Series A, and subsequently issued Indebtedness (exclusive of 2006 Revenue Bonds Series B and C), the proceeds of which are used or are scheduled to be used for the acquisition or construction of New Regional Assets or to refund such Indebtedness.

“Direct Retail” refers to Regional Water System capital or operating expenditures that are incurred to provide water service solely to Retail Customers.

“Direct Wholesale” refers to Regional Water System capital or operating expenditures that are incurred to provide water service solely to one or more Wholesale Customers.

“Drought” means a water shortage caused by lack of precipitation, as reflected in resolutions of the Commission calling for voluntary or mandatory water rationing based on evaluation of water stored or otherwise available to the Regional Water System, whether or not the Commission declares a water shortage emergency pursuant to Water Code §§ 350 et seq., as amended from time to time.

“Effective Date” refers to the date this Agreement will become effective in accordance with the terms of Section 1.03.

“Emergency” means a sudden, non-drought event, such as an earthquake, failure of Regional Water System infrastructure or other catastrophic event or natural disaster that results in an insufficient supply of water available to the Retail or Wholesale Service Areas for basic human consumption, firefighting, sanitation, and fire protection.

“Encumbrance” or **“Encumber”** refers to the process by which the City Controller certifies the availability of amounts previously appropriated by the Commission for specifically identified SFPUC capital projects performed either by third parties or through work orders to other City departments.

“Environmental Enhancement Surcharge” means the surcharge to be imposed by the SFPUC on individual parties to this Agreement whose use exceeds their Interim Supply Allocation when the collective use of water by all parties to this Agreement is in excess of the Interim Supply Limitation.

“ERRP” refers to a SFPUC document entitled *Emergency Response and Recovery Plan: Regional Water System* (“ERRP”) dated August 23, 2003, and updated November 2006.

“Excess Use Charges” are monthly charges set by the SFPUC, in the form of multipliers, that are applied to the Wholesale Customer water rates during times of mandatory rationing if a Wholesale Customer's water usage is greater than its shortage allocation. Excess Use Charges are further described in Section 4 of the Tier 1 Shortage Plan (Attachment H).

“Existing Assets” refers to Regional and Hetch Hetchy Water-Only and Water-Related capital assets plant in service as of June 30, 2009.

“Force Majeure Event” means an event not the fault of, and beyond the reasonable control of, the party claiming excuse which makes it impossible or extremely impracticable for such party to perform obligations imposed on it by this Agreement, by virtue of its effect on physical facilities and their operation or employees essential to such performance. Force Majeure Events include (a) an “act of God” such as an earthquake, flood, earth movement, or similar catastrophic event, (b) an act of the public enemy, terrorism, sabotage, civil disturbance or similar event, (c) a strike, work stoppage, picketing or similar concerted labor action, (d) delays in construction caused by unanticipated negligence or breach of contract by a third party or inability to obtain essential materials after diligent and timely efforts; or (e) an order or regulation issued by a federal or state regulatory agency after the Effective Date or a judgment or order entered by a federal or state court after the Effective Date.

“Fundamental Rights” of Wholesale Customers are their status as parties to this Agreement, their allocation of water recognized in Section 3.02, their protection against arbitrary, unreasonable, or unjustly discriminatory rates provided in Section 6.04, and any specific rights described in Article 9.

“Hetch Hetchy Enterprise” refers to Hetch Hetchy Water and Power Enterprise, a SFPUC operating department.

“Include” and its variants mean “including but not limited to” whenever used in this Agreement, regardless of whether or not it is capitalized.

“Indebtedness” includes revenue bonds, bond anticipation notes, certificates of participation (excluding certificates of participation towards which SFPUC contributes debt service as an operating expense), and commercial paper.

“Individual Water Sales Contract” refers to the contracts between each Wholesale Customer and San Francisco contemplated in Section 9.01 that details customer-specific matters such as location of service connections, service area maps and other matters specific to that customer.

“Individual Supply Guarantee” refers to each Wholesale Customer’s share of the Supply Assurance, as shown in Attachment C.

“Interim Supply Allocation” refers to each Wholesale Customer’s share, to be established by the SFPUC pursuant to Section 4.02, of the Interim Supply Limitation.

“Interim Supply Limitation” refers to the 265 MGD annual average limitation on water deliveries until December 31, 2018 from Regional Water System watersheds imposed by the SFPUC in its approval of the WSIP in Resolution Number 08-0200 dated October 30, 2008.

“Joint,” when used in connection with Hetch Hetchy Enterprise assets or expenses, refers to assets used or expenses incurred in providing both water supply (“Water-Related”) and in the generation and transmission of electrical energy (“Power-Related”).

“Local System Water” refers to Regional Water System water supplies developed in San Mateo, Alameda and Santa Clara Counties or otherwise not produced by the Hetch Hetchy Enterprise under rights of way granted by the Raker Act.

“MGD” refers to an average flow rate of one million gallons per day over a specific time period, often a year. For example, one MGD is equal to 365 million gallons per year or 1,120 acre feet per year.

“Net Annual Debt Service” refers to debt service less payments made from proceeds of Indebtedness (e.g., capitalized interest), earnings on bond proceeds (e.g., reserve fund earnings) used to pay Debt Service, and interest paid from renewed commercial paper, or from reserve fund liquidation.

“New Assets” refers to Regional and Hetch Hetchy Water-Only and Water-Related capital assets added to Regional Water System plant in service after June 30, 2009.

“New Regional Assets” refers to New Assets placed in service on or after July 1, 2009 that are used and useful in delivering water to Wholesale Customers. The following four categories comprise New Regional Assets:

1. Water Enterprise Regional Assets
2. Water Enterprise Direct Wholesale Assets
3. Hetch Hetchy Water Only Assets
4. Water-Related portion (45 percent) of Hetch Hetchy Joint Assets

“Power-Only,” when used with reference to Hetch Hetchy Enterprise capital costs and operating and maintenance expenses, means capital costs and expenses that are incurred solely for the construction and operation of assets used to generate and transmit electrical energy.

“Power-Related” refers to the power related portion (55%) of Joint Hetch Hetchy Enterprise assets or expenses.

“Prepayment” refers to payments of principal and interest amounts not due in the year the prepayment is made, as described in Section 5.03.

“Proportional Annual Use” means the shares of deliveries from the Regional Water System used by City Retail Customers and by the Wholesale Customers in a fiscal year, expressed as a percentage. The percentages of annual use are calculated each year as described in Section B of Attachment J and are shown on lines 10 and 11 of Table 1 of that Attachment.

“Proportional Water Use” refers the general principle of allocating Regional Water System costs based on the relative purchases of water by Retail and Wholesale Customers.

“Regional,” when used with reference to Water Enterprise capital assets and operating expenses, refers to assets and expenses that benefit Wholesale and Regional Customers.

“Regional Water System” means the water storage, transmission and treatment system operated by the SFPUC in Tuolumne, Stanislaus, San Joaquin, Alameda, Santa Clara, San Mateo and San Francisco counties, including projects constructed under the WSIP, but excluding Direct Retail and Direct Wholesale assets.

"Retail Customers" means any customer that purchases water from San Francisco that is not a Wholesale Customer, whether located inside or outside of San Francisco.

"Retail Service Area" means the areas where SFPUC sells water to Retail Customers.

"Retail Water" means water sold by the SFPUC to its Retail Customers within and outside San Francisco.

"San Francisco" refers to the City and County of San Francisco.

"SFPUC" refers to the San Francisco Public Utilities Commission as an operating department of San Francisco, the General Manager of which reports to the Commission.

"SFPUC Bureaus" refers to the portions of the SFPUC that provide support services to the SFPUC Operating Departments. These presently consist of the General Manager's Office, Business Services, and External Affairs.

"SFPUC Operating Departments" refers to the Water, Hetch Hetchy and Wastewater Program Enterprises under the control and management of the SFPUC pursuant to the San Francisco Charter.

"Substantially Expended": A bond issue series is substantially expended when 98% of the proceeds and investment earnings contributed to the project fund have been expended.

"Supply Assurance" means the 184 MGD maximum annual average metered supply of water dedicated by San Francisco to public use in the Wholesale Service Area (not including San Jose and Santa Clara) in the 1984 Agreement and Section 3.01 of this Agreement.

"Term" means the 25-year term commencing July 1, 2009, including one or both 5-year extensions authorized by Section 2.02.A and B.

"Tier 1 Shortage Plan" refers to the Water Shortage Allocation Plan (Attachment H) adopted by the SFPUC and the Wholesale Customers in conjunction with this Agreement describing the method for allocating water between the SFPUC and the Wholesale Customers collectively for shortages of up to 20% of deliveries from the Regional Water System, as amended from time-to-time.

“Water Enterprise” refers to the San Francisco Water Department (SFWD), an SFPUC Operating Department.

“Water Management Charge” refers to the charge collected by San Francisco on behalf of BAWSCA for local water resource development in the Wholesale Service Area pursuant to Section 3.06 of this Agreement.

“Water-Only,” when used with reference to Hetch Hetchy Enterprise capital costs and operating and maintenance expenses, means capital costs and expenses that are incurred solely for the construction and operation of assets used to protect water quality or to provide for the delivery of water for consumptive purposes.

“Water-Related” refers to the water related portion (45%) of Joint Hetch Hetchy Enterprise assets or expenses.

“Water Supply Development Report” refers to the annual report prepared pursuant to Section 4.05, and submitted to the Commission for purposes of estimating whether Regional Water System demand will be within the Interim Supply Limitation by June 30, 2018.

“Wheeling Statute” refers to Article 4 of Chapter 11 of the California Water Code, as amended from time to time.

“Wholesale Capital Fund” is the account established by the SFPUC for deposit of Wholesale Customer revenue that is used to fund the wholesale share of revenue-funded New Regional Assets, as described in Section 6.08.

“Wholesale Customer” or “Customers” means one or more of the 27 water customers identified in Section 1.01 that are contracting for purchase of water from San Francisco pursuant to this Agreement.

“Wholesale Revenue Coverage” refers to the additional dollar amount included in wholesale rates each fiscal year that is charged to Wholesale Customers by the SFPUC for their proportionate share of Debt Service coverage under Section 6.06.A.

“Wholesale Revenue Coverage Reserve” refers to the account established by the SFPUC for deposit of Wholesale Revenue Coverage under Section 6.06.B.

“Wholesale Revenue Requirement” means the calculated Wholesale Customer portion of SFPUC Regional Water System capital and operating costs as determined in accordance with the provisions of Article 5 of this Agreement, formerly called the “Suburban Revenue Requirement” in the 1984 Agreement.

“Wholesale Service Area” means the combined service areas of the Wholesale Customers, as delineated on the service area maps attached to each Individual Water Sales Contract.

“WSIP” refers to the Water System Improvement Program approved by the Commission in Resolution No. 08-0200 on October 30, 2008, as amended from time to time.

* 100 Cubic feet equals MGD divided by 0.00000204946. Figures in this column are calculated using unrounded MGD values and are more precise than the figures listed in column (2).

** Includes quantities from Los Trancos County Water District and Palomar Park Water District.

*** Total does not equal sum of MGD figures due to rounding. Total is not 184 MGD because table does not include the City of Hayward.

**** Cordilleras Mutual Water Association is not a party to this Agreement, but it has its own Supply Assurance of 3,007 hundred cubic feet (CCF).

ATTACHMENT D

PROCEDURE FOR PRO-RATA REDUCTION OF WHOLESALE CUSTOMERS' INDIVIDUAL SUPPLY GUARANTEES (SECTION 3.02).

The 23 wholesale customers listed on Attachment C have individual Supply Guarantees that total approximately 161.9 MGD.

If the amount of water purchased from SFPUC by Hayward exceeds 22.1 MGD for three consecutive fiscal years, the individual Supply Guarantees of each of those 23 wholesale customers will be reduced as described below.

STEP ONE:

Obtain the average annual excess purchases during the three fiscal year period. For example, assume Hayward uses 25.0 MGD, 24.2 MGD and 26.0 MGD in three consecutive years. The average annual excess use for that period is 2.9 MGD; calculated as follows:

$$\frac{[25.0\text{ MGD} + 24.2\text{ MGD} + 26.0\text{ MGD}]}{3} + 161.9\text{ MGD} = 186.9\text{ MGD}$$

$$186.9\text{ MGD} - 184.0\text{ MGD} = 2.9\text{ MGD}$$

STEP TWO:

Allocate the excess purchases among the 23 Wholesale Customers in proportion to each customer's Supply Guarantee as a percentage of the total Supply Guarantees (161.9 MGD as of FY 2009-10).

For example, assume that Wholesale Customer A's Supply Guarantee is 12.0 MGD. Wholesale Customer A's percentage share of the total individual supply guarantees is 0.074, calculated as follows:

$$\frac{12.0\text{ MGD}}{161.9\text{ MGD}} = 0.074$$

and its share of the excess use is 0.22 MGD, calculated as follows:

2.9 MGD x 0.074 = 0.22 MGD

STEP THREE:

Determine Wholesale Customer's adjusted Supply Guarantee by subtracting the result of Step Two from the Wholesale Customer's Supply Guarantee:

12 MGD - 0.22 MGD = 11.78 MGD

* * * * * * * * * *

Adjustments will be made at intervals comprised of distinct three-year periods of use by Hayward in excess of 22.1 MGD rather than overlapping periods. For example, assuming that the first adjustment were to occur in FY 2014-15 (based on use during FY 2011-12, FY 2012-13 and FY 2013-14), a second adjustment will not occur earlier than three full fiscal years thereafter (i.e., FY 2017-18, based on use by Hayward in FY 2014-15, FY 2015-16 and FY 2016-17). The figures used in the second and subsequent adjustments will reflect previous adjustments. For example, a second adjustment will use 158.9 MGD as the total of individual Supply Guarantees (161.6 MGD - 2.7 MGD = 158.9 MGD).

For purposes of simplicity, the volumetric units used in the foregoing example are MGD. For actual adjustment calculations, the unit employed will be hundreds of cubic feet ("ccf"), the unit by which the SFPUC measures water deliveries for billing purposes.

The procedure described and illustrated above is independent of and unrelated to the establishment by the SFPUC of Interim Supply Limitations described in Article 4.

WATER SALES CONTRACT

This Contract, dated as of ____________, 2009, is entered into by and between the City and County of San Francisco ("San Francisco") and

____

____ ("Customer").

RECITALS

San Francisco and the Customer have entered into a Water Supply Agreement ("WSA"), which sets forth the terms and conditions under which San Francisco will continue to furnish water for domestic and other municipal purposes to Customer and to other Wholesale Customers. The WSA contemplates that San Francisco and each individual Wholesale Customer will enter into an individual contract describing the location or locations at which water will be delivered to each customer by the San Francisco Public Utilities Commission ("SFPUC"), the customer's service area within which water so delivered is to be sold, and other provisions unique to the individual purchaser. This Water Sales Contract is the individual contract contemplated by the WSA.

AGREEMENTS OF THE PARTIES

1. Incorporation of the WSA

The terms and conditions of the WSA are incorporated into this Contract as if set forth in full herein.

2. Term

Unless explicitly provided to the contrary in Article 9 of the WSA, the term of this Contract shall be identical to that provided in Section ___ of the WSA.

3. Service Area

Water delivered by San Francisco to the Customer may be used or sold within the service area shown on the map designated Exhibit A attached hereto. Except as provided in Section ___ of the WSA, Customer shall not deliver or sell any water provided by San Francisco outside of this area without the prior written consent of the General Manager of the SFPUC.

4. Location and Description of Service Connections

Sale and delivery of water to Customer will be made through a connection or connections to the SFPUC Regional Water System at the location or locations shown on Exhibit A attached hereto and with the applicable present account number, description, connection size, and meter size shown on Exhibit B attached hereto.

5. Interties With Other Systems.

Customer maintains interties with neighboring water systems at the location or locations shown on Exhibit A attached hereto and with the connection size(s) as shown on Exhibit C attached hereto.

6. Billing and Payment

San Francisco shall compute the amounts of water delivered and bill Customer therefor on a monthly basis. The bill shall show the separate components of the charge (e.g., service, consumption, demand). Customer shall pay the amount due within thirty (30) days after receipt of the bill.

If Customer disputes the accuracy of any portion of the water bill it shall (a) notify the General Manager of the SFPUC in writing of the specific nature of the dispute and (b) pay the undisputed portion of the bill within thirty (30) days after receipt. Customer shall meet with the General Manager of the SFPUC or a delegate to discuss the disputed portion of the bill.

7., 8., 9... Other Specialized Provisions

[Certain Wholesale Customers will require additional provisions in their individual contracts addressed to issues such as minimum and/or maximum water delivery quantities, prior authorized wheeling arrangements, maximum expansion of the service area, etc. These and other provisions addressing issues unique to the particular Wholesale Customer may be added here, subject to the provisions of Section 9.01 of the WSA.]

IN WITNESS WHEREOF, the parties hereto have executed this Contract, to become effective upon the effectiveness of the WSA, by their duly authorized representatives.

CITY AND COUNTY OF SAN FRANCISCO Acting by and through its Public Utilities Commission BY ______________________________ Edward Harrington General Manager	Date: _____, 2009
NAME OF WHOLESALE CUSTOMER BY ______________________________ Name: Title:	Date: _____, 2009

Note: This attachment is provided for the convenience of the prospective parties to the Water Supply Agreement and associated individual contracts. The format may be modified as desired by San Francisco and Wholesale Customer, subject to Section 9.01 of the WSA.

WATER SHORTAGE ALLOCATION PLAN

This Interim Water Shortage Allocation Plan ("Plan") describes the method for allocating water between the San Francisco Public Utilities Commission ("SFPUC") and the Wholesale Customers collectively during shortages caused by drought. The Plan implements a method for allocating water among the individual Wholesale Customers which has been adopted by the Wholesale Customers. The Plan includes provisions for transfers, banking, and excess use charges. The Plan applies only when the SFPUC determines that a system-wide water shortage due to drought exists, and all references to "shortages" and "water shortages" are to be so understood. This Plan was adopted pursuant to Section 7.03(a) of the 1984 Settlement Agreement and Master Water Sales Contract and has been updated to correspond to the terminology used in the June 2009 Water Supply Agreement between the City and County of San Francisco and Wholesale Customers in Alameda County, San Mateo County and Santa Clara County ("Agreement").

SECTION 1. SHORTAGE CONDITIONS

1.1. Projected Available SFPUC Water Supply. The SFPUC shall make an annual determination as to whether or not a shortage condition exists. The determination of projected available water supply shall consider, among other things, stored water, projected runoff, water acquired by the SFPUC from non-SFPUC sources, inactive storage, reservoir losses, allowance for carryover storage, and water bank balances, if any, described in Section 3.

1.2 Projected SFPUC Purchases. The SFPUC will utilize purchase data, including volumes of water purchased by the Wholesale Customers and by Retail Customers (as those terms are used in the Agreement) in the year immediately prior to the drought, along with other available relevant information, as a basis for determining projected system-wide water purchases from the SFPUC for the upcoming year.

1.3. Shortage Conditions. The SFPUC will compare the available water supply (Section 1.1) with projected system-wide water purchases (Section 1.2). A shortage condition exists if the SFPUC determines that the projected available water supply is less than projected system-wide water purchases in the upcoming Supply Year (defined as the period from July 1 through June 30). When a shortage condition exists, SFPUC will determine whether voluntary or mandatory actions will be required to reduce purchases of SFPUC water to required levels.

1.3.1 Voluntary Response. If the SFPUC determines that voluntary actions will be sufficient to accomplish the necessary reduction in water use throughout its service area, the SFPUC and the Wholesale Customers will make good faith efforts to reduce their water purchases to stay within their annual shortage allocations and associated monthly water use budgets. The SFPUC will not impose excess use charges during periods of voluntary rationing, but may suspend the prospective accumulation of water bank credits, or impose a ceiling on further accumulation of bank credits, consistent with Section 3.2.1 of this Plan.

1.3.2 Mandatory Response. If the SFPUC determines that mandatory actions will be required to accomplish the necessary reduction in water use in the SFPUC service area, the SFPUC may implement excess use charges as set forth in Section 4 of this Plan.

1.4. Period of Shortage. A shortage period commences when the SFPUC determines that a water shortage exists, as set forth in a declaration of water shortage emergency issued by the SFPUC pursuant to California Water Code Sections 350 et seq. Termination of the water shortage emergency will be declared by resolution of the SFPUC.

SECTION 2. SHORTAGE ALLOCATIONS

2.1. Annual Allocations between the SFPUC and the Wholesale Customers. The annual water supply available during shortages will be allocated between the SFPUC and the collective Wholesale Customers as follows:

Level of System Wide Reduction in Water Use Required	Share of Available Water	
	SFPUC Share	Wholesale Customers Share
5% or less	35.5%	64.5%
6% through 10%	36.0%	64.0%
11% through 15%	37.0%	63.0%
16% through 20%	37.5%	62.5%

The water allocated to the SFPUC shall correspond to the total allocation for all Retail Customers.

2.2 Annual Allocations among the Wholesale Customers. The annual water supply allocated to the Wholesale Customers collectively during system wide shortages of 20 percent or less will be apportioned among them based on a methodology adopted by all of the Wholesale Customers, as described in Section 3.11(C) of the Agreement. In any year for which the methodology must be applied, the Bay Area Water Supply and Conservation Agency ("BAWSCA") will calculate each Wholesale Customer's individual percentage share of the amount of water allocated to the Wholesale Customers collectively pursuant to Section 2.1. Following the declaration or reconfirmation of a water shortage emergency by the SFPUC, BAWSCA will deliver to the SFPUC General Manager a list, signed by the President of BAWSCA's Board of Directors and its General Manager, showing each Wholesale Customer together with its percentage share and stating that the list has been prepared in accordance with the methodology adopted by the Wholesale Customers. The SFPUC shall allocate water to each Wholesale Customer, as specified in the list. The shortage allocations so established may be transferred as provided in Section 2.5 of this Plan. If BAWSCA or all Wholesale Customers do not provide the SFPUC with individual allocations, the SFPUC may make a final allocation decision after first meeting and discussing allocations with BAWSCA and the Wholesale Customers.

The methodology adopted by the Wholesale Customers utilizes the rolling average of each individual Wholesale Customer's purchases from the SFPUC during the three immediately preceding Supply Years. The SFPUC agrees to provide BAWSCA by November 1 of each year a list showing the amount of water purchased by each Wholesale Customer during the immediately preceding Supply Year. The list will be prepared using Customer Service Bureau report MGT440 (or comparable official record in use at the time), adjusted as required for any reporting errors or omissions, and will be transmitted by the SFPUC General Manager or his designee.

2.3. Limited Applicability of Plan to System Wide Shortages Greater Than Twenty Percent. The allocations of water between the SFPUC and the Wholesale Customers collectively, provided for in Section 2.1, apply only to shortages of 20 percent or less. The SFPUC and Wholesale Customers recognize the possibility of a drought occurring which could create system-wide shortages greater than 20 percent despite actions taken by the SFPUC aimed at reducing the probability and severity of water shortages in the SFPUC service area. If the SFPUC determines that a system wide water shortage greater than 20 percent exists, the SFPUC and the Wholesale Customers agree to meet within 10 days and discuss whether a change is required to the allocation set forth in Section 2.1 in order to mitigate undue hardships that might otherwise be experienced by individual Wholesale Customers or Retail Customers. Following these discussions, the Tier 1 water allocations set forth in Section 2.1 of this Plan, or a modified version thereof, may be adopted by mutual written consent of the SFPUC and the Wholesale Customers. If the SFPUC and Wholesale Customers meet and cannot agree on an appropriate Tier 1 allocation within 30 days of the SFPUC's determination of water shortage greater than 20 percent, then (1) the provisions of Section 3.11(C) of the Agreement will apply, unless (2) all of the Wholesale Customers direct in writing that a Tier 2 allocation methodology agreed to by them be used to apportion the water to be made available to the Wholesale Customers collectively, in lieu of the provisions of Section 3.11(C).

The provisions of this Plan relating to transfers (in Section 2.5), banking (in Section 3), and excess use charges (in Section 4) shall continue to apply during system-wide shortages greater than 20 percent.

2.4. Monthly Water Budgets. Within 10 days after adopting a declaration of water shortage emergency, the SFPUC will determine the amount of Tier 1 water allocated to the Wholesale Customers collectively pursuant to Section 2.1. The SFPUC General Manager, using the Tier 2 allocation percentages shown on the list delivered by BAWSCA pursuant to Section 2.2, will calculate each Wholesale Customer's individual annual allocation. The SFPUC General Manager, or his designee, will then provide each Wholesale Customer with a proposed schedule of monthly water budgets based on the pattern of monthly water purchases during the Supply Year immediately preceding the declaration of shortage (the "Default Schedule"). Each Wholesale Customer may, within two weeks of receiving its Default Schedule, provide the SFPUC with an alternative monthly water budget that reschedules its annual Tier 2 shortage allocation over the course of the succeeding Supply Year. If a Wholesale Customer does not deliver an alternative monthly water budget to the SFPUC within two weeks of its receipt of the Default Schedule, then its monthly budget for the ensuing Supply Year shall be the Default Schedule proposed by the SFPUC.

Monthly Wholesale Customer water budgets will be derived from annual Tier 2 allocations for purposes of accounting for excess use. Monthly Wholesale Customer water budgets shall be adjusted during the year to account for transfers of shortage allocation under Section 2.5 and transfers of banked water under Section 3.4.

2.5. Transfers of Shortage Allocations. Voluntary transfers of shortage allocations between the SFPUC and any Wholesale Customers, and between any Wholesale Customers, will be permitted using the same procedure as that for transfers of banked water set forth in Section 3.4. The SFPUC and BAWSCA shall be notified of each transfer. Transfers of shortage allocations shall be deemed to be an emergency transfer and shall become effective on the third business day after notice of the transfer has been delivered to the SFPUC. Transfers of shortage allocations shall be in compliance with Section 3.05 of the Agreement. The transferring parties will meet with the SFPUC, if requested, to discuss any effect the transfer may have on its operations.

SECTION 3. SHORTAGE WATER BANKING

3.1. Water Bank Accounts. The SFPUC shall create a water bank account for itself and each Wholesale Customer during shortages in conjunction with its resale customer billing process. Bank accounts will account for amounts of water that are either saved or used in excess of the shortage allocation for each agency; the accounts are not used for tracking billings and payments. When a shortage period is in effect (as defined in Section 1.4), the following provisions for bank credits, debits, and transfers shall be in force. A statement of bank balance for each Wholesale Customer will be included with the SFPUC's monthly water bills.

3.2. Bank Account Credits. Each month, monthly purchases will be compared to the monthly budget for that month. Any unused shortage allocation by an agency will be credited to that agency's water bank account. Credits will accumulate during the entire shortage period, subject to potential restrictions imposed pursuant to Section 3.2.1. Credits remaining at the end of the shortage period will be zeroed out; no financial or other credit shall be granted for banked water.

3.2.1. Maximum Balances. The SFPUC may suspend the prospective accumulation of credits in all accounts. Alternatively, the SFPUC may impose a ceiling on further accumulation of credits in water bank balances based on a uniform ratio of the bank balance to the annual water allocation. In making a decision to suspend the prospective accumulation of water bank credits, the SFPUC shall consider the available water supply as set forth in Section 1.1 of this Plan and other reasonable, relevant factors.

3.3. Account Debits. Each month, monthly purchases will be compared to the budget for that month. Purchases in excess of monthly budgets will be debited against an agency's water bank account. Bank debits remaining at the end of the fiscal year will be subject to excess use charges (see Section 4).

3.4. Transfers of Banked Water. In addition to the transfers of shortage allocations provided for in Section 2.5, voluntary transfers of banked water will also be permitted between the SFPUC and any Wholesale Customer, and among the Wholesale Customers. The volume of transferred water will be credited to the transferee's water bank account and debited against the transferor's water bank account. The transferring parties must notify the SFPUC and BAWSCA of each transfer in writing (so that adjustments can be made to bank accounts), and will meet with the SFPUC, if requested, to discuss any affect the transfer may have on SFPUC operations. Transfers of banked water shall be deemed to be an emergency transfer and shall become effective on the third business day after notice of the transfer has been delivered to the SFPUC.

If the SFPUC incurs extraordinary costs in implementing transfers, it will give written notice to the transferring parties within ten (10) business days after receipt of notice of the transfer. Extraordinary costs means additional costs directly attributable to accommodating transfers and which are not incurred in non-drought years nor simply as a result of the shortage condition itself. Extraordinary costs shall be calculated in accordance with the procedures in the Agreement and shall be subject to the disclosure and auditing requirements in the Agreement. In the case of transfers between Wholesale Customers, such extraordinary costs shall be considered to be expenses chargeable solely to individual Wholesale Customers and shall be borne equally by the parties to the transfer. In the case of transfers between the SFPUC and a Wholesale Customer, the SFPUC's share of any extraordinary transfer costs shall not be added to the Wholesale Revenue Requirement.

3.4.1. Transfer Limitations. The agency transferring banked water will be allowed to transfer no more than the accumulated balance in its bank. Transfers of estimated prospective banked credits and the "overdrafting" of accounts shall not be permitted. The price of transfer water originally derived from the SFPUC system is to be determined by the transferring parties and is not specified herein. Transfers of banked water shall be in compliance with Section 3.05 of the Agreement.

SECTION 4. WHOLESALE EXCESS USE CHARGES

4.1. Amount of Excess Use Charges. Monthly excess use charges shall be determined by the SFPUC at the time of the declared water shortage consistent with the calendar in Section 6 and in accordance with Section 6.03 of the Agreement. The excess use charges will be in the form of multipliers applied to the rate in effect at the time the excess use occurs. The same excess use charge multipliers shall apply to the Wholesale Customers and all Retail Customers. The excess use charge multipliers apply only to the charges for water delivered at the rate in effect at the time the excess use occurred.

4.2 Monitoring Suburban Water Use. During periods of voluntary rationing, water usage greater than a customer's allocation (as determined in Section 2) will be indicated on each SFPUC monthly water bill. During periods of mandatory rationing, monthly and cumulative water usage greater than a Wholesale Customer's shortage allocation and the associated excess use charges will be indicated on each SFPUC monthly water bill.

4.3. Suburban Excess Use Charge Payments. An annual reconciliation will be made of monthly excess use charges according to the calendar in Section 6. Annual excess use charges will be calculated by comparing total annual purchases for each Wholesale Customer with its annual shortage allocation (as adjusted for transfers of shortage allocations and banked water, if any). Excess use charge payments by those Wholesale Customers with net excess use will be paid according to the calendar in Section 6. The SFPUC may dedicate excess use charges paid by Wholesale Customers toward the purchase of water from the State Drought Water Bank or other willing sellers in order to provide additional water to the Wholesale Customers. Excess use charges paid by the Wholesale Customers constitute Wholesale Customer revenue and shall be included within the SFPUC's annual Wholesale Revenue Requirement calculation.

SECTION 5. GENERAL PROVISIONS GOVERNING WATER SHORTAGE ALLOCATION PLAN

5.1. Construction of Terms. This Plan is for the sole benefit of the parties and shall not be construed as granting rights to any person other than the parties or imposing obligations on a party to any person other than another party.

5.2. Governing Law. This Plan is made under and shall be governed by the laws of the State of California.

5.3. Effect on Agreement. This Plan describes the method for allocating water between the SFPUC and the collective Wholesale Customers during system-wide water shortages of 20 percent or less. This Plan also provides for the SFPUC to allocate water among the Wholesale Customers in accordance with directions provided by the Wholesale Customers through BAWSCA under Section 2.2, and to implement a program by which such allocations may be voluntarily transferred among the Wholesale Customers. The provisions of this Plan are intended to implement Section 3.11(C) of the Agreement and do not affect, change or modify any other section, term or condition of the Agreement.

5.4. Inapplicability of Plan to Allocation of SFPUC System Water During Non-Shortage Periods. The SFPUC's agreement in this Plan to a respective share of SFPUC system water during years of shortage shall not be construed to provide a basis for the allocation of water between the SFPUC and the Wholesale Customers when no water shortage emergency exists.

5.5. Termination. This Plan shall expire at the end of the Term of the Agreement.. The SFPUC and the Wholesale Customers can mutually agree to revise or terminate this Plan prior to that date due to changes in the water delivery capability of the SFPUC system, the acquisition of new water supplies, and other factors affecting the availability of water from the SFPUC system during times of shortage.

SECTION 6. ALLOCATION CALENDAR

6.1. Annual Schedule. The annual schedule for the shortage allocation process is shown below. This schedule may be changed by the SFPUC to facilitate implementation.

6.1.1

In All Years	Target Dates
1. SFPUC delivers list of annual purchases by each Wholesale Customer during the immediately preceding Supply Year	November 1
2. SFPUC meets with the Wholesale Customers and presents water supply forecast for the following Supply Year	February
3. SFPUC issues initial estimate of available water supply	February 1
4. SFPUC announces potential first year of drought (if applicable)	February 1
5. SFPUC and Wholesale Customers meet upon request to exchange information concerning water availability and projected system-wide purchases	February 1-May 31
6. SFPUC issues revised estimate of available water supply, and confirms continued potential shortage conditions, if applicable	March 1
7. SFPUC issues final estimate of available water supply	April 15th or sooner if adequate snow course measurement data is available to form a robust estimate on available water supply for the coming year.
8. SFPUC determines amount of water available to Wholesale Customers collectively	April 15th or sooner if adequate snow course measurement data is available to form a robust estimate on available water supply for the coming year.

In Drought Years	Target Dates
9. SFPUC formally declares the existence of water shortage emergency (or end of water shortage emergency, if applicable) under Water Code Sections 350 et. seq.	April 15-31
10. SFPUC declares the need for a voluntary or mandatory response	April 15-31
11. BAWSCA submits calculation to SFPUC of individual Wholesale Customers' percentage shares of water allocated to Wholesale Customers collectively	April 15- 31
12. SFPUC determines individual shortage allocations, based on BAWSCA's submittal of individual agency percentage shares to SFPUC, and monthly water budgets (Default Schedule)	April 25—May 10
13. Wholesale Customers submit alternative monthly water budgets (optional)	May 8-May 24
14. Final drought shortage allocations are issued for the Supply Year beginning July 1 through June 30	June 1
15. Monthly water budgets become effective	July 1
16. Excess use charges indicated on monthly Suburban bills	August 1 (of the beginning year) through June 30 (of the succeeding year)
17. Excess use charges paid by Wholesale Customers for prior year	August of the succeeding year

ATTACHMENT I

NOT USED

ATTACHMENT J

DEFINITIONS AND FORMULAS FOR
CALCULATING PROPORTIONAL ANNUAL WATER USE

TABLE OF CONTENTS

This Attachment contains four sections, three figures, and five tables.

Table 1 presents the format for the water usage and allocation rate calculations for reference and to illustrate the definitions and formulas described in Sections A through C. Tables 2 and 3 list the meters whose locations are shown on Figures 1 and 3, respectively. Table

4 identifies the type of meter and associated metering equipment for the County-line Meters and Terminal Reservoirs. Table 5 identifies the meter calibration and maintenance frequency for the meters and equipment listed in Table 4.

SECTION A. WATER METERS

1. General

The Agreement provides that certain operating and maintenance expenses and the capital cost of certain categories of utility plant in service are to be allocated between San Francisco and the Wholesale Customers on the basis of proportionate annual usage of the Regional Water System. The purpose of this Attachment is to describe the meters and illustrate the method by which proportionate annual usage will be calculated.

2. Units of Measurement, Rounding, Conversion

The SFPUC will compile the usage data required to complete Table 1 annually. The units of measurement and conventions for converting and rounding will be as follows.

The data in the Table 1 will be presented, and the calculations contemplated by this Attachment shown, in units of millions of gallons per day (mgd), rounded to the nearest tenth of an mgd. Percentages (e.g., the City and Wholesale usage rates) shall be carried to two digits to the right of the decimal point and reduction factors shall be carried to four digits to the right of the decimal point. Data compiled by the SFPUC in units of hundreds of cubic feet per year (ccf) shall be converted to mgd by multiplying hundreds of cubic feet per year by 0.0000020493 (or 2.0493×10^{-6}) for non-leap years and 0.0000020437 (or 2.0437×10^{-6}) for leap years.

In rounding, if the rightmost digit dropped is 0 through 4, the preceding digit shall be left unchanged; if the rightmost digit dropped is 5 through 9, the preceding digit shall be increased by 1.

3. Location of Meters/Gauges

The SFPUC presently maintains meters and gauges that have been used to determine the proportionate usage of the Regional Water System, in accordance with the methods and calculations described in Exhibit J to the 1984 contract between San Francisco and the Wholesale Customers. These meters consist of "County-Line Meters," "In-City Terminal Reservoir Meters" and "System Input and In-line Meters" as described in the following subsections. As new capital improvement projects are designed and constructed by the SFPUC, it may be necessary for new meters to be installed to ensure continued accurate determinations of the proportionate usage of the Regional Water System. "Planned meters" are included in the following subsections where planned capital improvement projects are likely to require the installation of additional meters.

a. County-line Meters

The SFPUC presently maintains meters at or near the San Mateo-San Francisco County line to measure flow through all transmission pipelines entering the City ("County-line Meters"). The existing and planned County-line Meters are listed in Table 2 and shown on Figures 1 and 2. Additional details pertaining to the County-line meters located at the Lake Merced Pump Station, and specifically to water deliveries from the pump station to Sunset Reservoir, Sutro Reservoir, and Lake Merced are provided below.

(1) County-Line deliveries to Sunset and Sutro Reservoirs

Water delivered to the City through the Sunset Supply Pipeline may be pumped from the Lake Merced Pump Station to either Sunset Reservoir or Sutro Reservoir located within the City. When water is pumped from the Lake Merced Pump Station to both Sunset and Sutro reservoirs simultaneously, the recording instrumentation on the Sunset and Sutro venturi meters are designed to record flows through both meters. When water is pumped to Sutro Reservoir only (typically utilizing Pump No. 4 at the

Lake Merced Pump Station), the source water is from the Sunset Reservoir (not the County-line), and the direction of flow through the Sunset venturi meter is reversed. Under this pumping scenario, the recording instrumentation on the Sunset and Sutro venturi meters are designed to not record flow on their respective recorders such that the in-City transfer of water between Sunset and Sutro Reservoirs is not included as a County-line delivery to the City. Figure 2 provides a generalized schematic of the Lake Merced Pump Station and the typical direction of flow from the County-line, through the pump station.

(2) <u>County-line deliveries to Lake Merced</u>
In order to raise and maintain water levels in Lake Merced, the SFPUC occasionally delivers water directly from the Regional Water System to Lake Merced. Deliveries from the Regional Water System to Lake Merced are accomplished at the Lake Merced Pump Station. The procedure involves operating valves on the suction side of Sunset Pump No. 2 such that water may flow by gravity in the Sunset Supply Pipeline, from San Mateo County, across the County-line and into San Francisco, through Lake Merced Pump Station and into the Lake Merced wet well. A 16-inch pipeline connection on the suction side of Sunset Pump No. 2 allows for deliveries of water to the wet well (see Figure 2). Water deliveries from the Regional Water System to Lake Merced are considered County-line deliveries and an in-City usage in the calculation of water allocation rates.

b. <u>In-City Terminal Reservoirs</u>

Water usage by the City includes water deliveries from the SFPUC's "terminal reservoirs." The terminal reservoirs are: 1) Sunset Reservoir, 2) University Mound Reservoir, and 3) Merced Manor Reservoir. The terminal reservoirs are shown on Figure 1.

c. <u>System Input and In-Line Meters</u>

The SFPUC presently measures water flow into and through the Regional System utilizing "System Input and In-Line Meters." The existing and planned System Input and In-Line Meters are listed in Table 3 and shown on Figure 3.

d. <u>Wholesale Customer Meters and City Retail Customer Meters Located Outside the Boundaries of the City</u>

The SFPUC presently measures water deliveries from the Regional Water System to its Wholesale Customers at various locations where the water delivery systems of the individual Wholesale Customers tie into the Regional Water System. The meters at these locations are referred to as the Wholesale Customers' "master meters." The SFPUC also measures water deliveries from the Regional Water System to other customers located outside of the boundaries of the City that are not Wholesale Customers. Water deliveries to the Wholesale Customers and Retail Customers outside the City's boundaries that receive water from the Regional Water System are accounted for by the SFPUC's Customer Service Division as described in Section B.

4. <u>Replacement and Relocation of Meters, Gauges, and Recording Devices</u>.

The SFPUC presently equips all of its large venturi meters with differential pressure transmitters. The smaller meters utilize other methods and equipment to register and record flows. The SFPUC will maintain the meters, gauges, and recording devices described above in subsections (a), (b), (c), and (d) unless and until such meters, gauges, and recording devices are replaced.

The SFPUC may replace the meters, gauges, and recording devices described above in subsections (a), (b), (c), and (d) or install new meters, gauges, and recording devices at new locations, provided that such changes do not diminish the accuracy of the water flow measurements or impair the ability of the SFPUC to separate direct City water use from water use by the wholesale customers. Maintenance and calibration procedures for new or replaced equipment may change. Modified maintenance and calibration procedures for new or replaced equipment will conform to industry standards set forth in AWWA Manual M33, the applicable standards in the International Society of Automation, and will implement the manufacturer's instructions for maintenance and calibration. The SFPUC will provide BAWSCA with advance written notice of any such changes, together with a brief explanation of the reasons therefor and a description of the type and location of the replacement. Such notice shall automatically amend the list of meters, gauges, and recording devices set forth above in subsections (a), (b), (c), and (d).

5. Recording of Water Flow Data

a. Flow Data

The City shall record and maintain data measuring base water flow throughout the SFPUC Regional Water System as necessary to determine proportional annual water usage.

b. Reservoir Data

The SFPUC shall record and maintain data measuring the levels of the terminal reservoirs described above in subsection A.3.b and shown on Figure 1 on an hourly basis. Flow values derived from reservoir level readings for all reservoirs in the SFPUC wholesale system shall be calculated using the tables contained in the SFPUC publication "Reservoir Data" (aka "The Weir Book"), which set forth the relationship between reservoir levels and water volumes, as such tables may be amended from time to time to reflect changes in the volumes of the various reservoirs. The tables to be used initially shall be those from the current edition of The Weir Book.

SECTION B. CALCULATION OF PROPORTIONAL ANNUAL USAGE

"Base rates" means the percentages of annual SFPUC deliveries attributed to the Wholesale Customers and to City Retail Customers.

The percentage of annual SFPUC metered deliveries attributed to the Wholesale Customers (i.e., the wholesale base rate) shall be calculated for each fiscal year as described below and illustrated in Table 1. The item numbers listed below correspond to the item numbers listed in Table 1.

(1) "Gross San Francisco County line base deliveries" shall equal the total amount of water flowing into the City's distribution system through transmission pipelines entering the City, as measured by the County-Line Meters described in Section A.3.a. and shown on Figures 1 and 2.

(2) "Daly City base deliveries" shall equal the water flowing to Daly City through meter accounts provided downstream of the County-Line meters or through SFPUC's City Distribution Division. At present these accounts are:

 (a) CSPL1/Macdonald Avenue Service (Account number 010084-01-0)
 (b) Guttenberg Street Service (Account number 010013-01-3)
 (c) Carter Street Service (Account numbers 284070-01-8 and 284071-01-6)

These accounts represent a portion of the total deliveries to Daly City. The quantities of water delivered to these four Daly City accounts are reported monthly in Form MGT441 by the SFPUC's Customer Service Division. These connections to meters are presently located within the City, and thus record water which has already been recorded by the SFPUC's master meters at the County line. So long as this condition continues, Daly City base deliveries shall be subtracted from "Gross San Francisco County line base deliveries."

(3) "Net San Francisco base deliveries" shall equal the result of subtracting "Daly City base deliveries" from "Gross San Francisco County line base deliveries."

(4) "Other suburban raw water base deliveries" shall equal the sum of all deliveries of raw (untreated) water to customers of the SFPUC located outside the City other than deliveries to the Wholesale Customers. "Other suburban raw water base deliveries" include deliveries of raw water in Alameda and San Mateo Counties to SFPUC Retail Customers, City departments and commissions, and other users affiliated with San Francisco.

(5) "Other suburban treated water base deliveries" shall equal the sum of all deliveries of treated water to customers of the SFPUC located outside the City other than deliveries to the Wholesale Customers. Other suburban treated water base deliveries include deliveries of treated water to the SFPUC's Retail Customers in San Mateo, Santa Clara and Alameda Counties (such as NASA Ames Research Center and LLNL), to City departments and commissions and other users affiliated with San Francisco (such as the San Francisco International Airport, the San Francisco County Jail, and tenants of land owned by the City Recreation and Park Department).

(6) "Other suburban base deliveries" shall equal the sum of "Other suburban raw water deliveries" and "Other suburban treated water deliveries." The combined amount of raw and treated water delivered to suburban entities other than the Wholesale Customers is reported monthly in Form MGT440 by the SFPUC's Customer Service Division.

(7) "Total City base usage" shall equal "Net San Francisco base deliveries" plus "Other suburban base deliveries."

(8) "Total wholesale base usage" shall equal the sum of all metered deliveries to the Wholesale Customers measured at their SFPUC master meters (including all deliveries to Daly City which are comprised of deliveries through meters located outside San Francisco and meters located inside San Francisco, deliveries through the latter of which are designated above in paragraph B.1.2 as "Daly City base

deliveries"). The quantity of water delivered to the individual Wholesale Customers, and the combined amount of water delivered to all Wholesale Customers is reported monthly in Form MGT440 by the SFPUC's Customer Service Division.

(9) "Total system base usage" shall equal "City base usage" plus "Wholesale base usage."

(10) "Wholesale base rate" shall equal the percentage obtained by dividing "Wholesale base usage" by "Total system base usage."

(11) "City base rate" shall equal the percentage obtained by subtracting "Wholesale base rate" from 100 percent.

(12) "Base system input" shall equal all amounts of water supplied to the SFPUC Regional Water System, which presently comes from the following sources:

(a) Hetch Hetchy water as measured at the venturi meters on the 58–inch, 61-inch, and 78.5-inch San Joaquin Pipeline Nos. 1, 2, and 3 near Oakdale.

(b) Water supplied by HHWPD to LLNL as measured at the customer meter. Water delivered from the system to LLNL shall be deemed negative in sign for the purpose of determining "Base system input."

(c) Hetch Hetchy water pumped from the Alameda siphons to San Antonio Reservoir as measured at the venturi meter on the 60-inch San Antonio pipeline. Water delivered from the system to San Antonio Reservoir shall be deemed negative in sign for the purpose of determining "Base system input."

(d) Sunol Valley Water Treatment Plant as measured at the meter on the 78-inch effluent pipeline.

(e) Harry Tracy Water Treatment Plant as measured at the venturi meters on the 60-inch and 78-inch effluent pipelines.

(f) Raw water deliveries to all SFPUC Retail Customers outside the City boundaries as measured at the customer meter. These deliveries are considered positive for the purposes of Table 1. Currently, raw water deliveries to the system are represented by the following account numbers contained in Form MGT440 prepared by the SFPUC's Customer Service Division:

266081-01-7 (Calaveras Nursery)
266081-02-5 (Calaveras Nursery)
264355-01-7 (Caltrans)
266084-02-9 (Color Spot Nursery)
272701-02-0 (Color Spot Nursery)
266069-02-0 (Crystal Springs Golf Course)
266078-02-1 (Dell Franklin)
266078-01-3 (Dells Nursery)
266084-01-1 (Hi-C Nursery)
272701-01-2 (Hi-C Nursery)
284112-01-8 (Hansen Aggregates)
266084-03-7 (Jeff Anhorn Nursery)
272701-03-8 (Jeff Anhorn Nursery)
266079-02-9 (Mission Valley Rock)
281043-01-8 (Mission Valley Rock)
267618-02-3 (Nagata Farms)
267618-01-5 (Nagata Farms)
266090-01-8 (Naka Nursery)

266091-01-6 (Naka Nursery)
266090-02-6 (Naka Nursery)
266091-02-4 (Naka Nursery)
264315-02-9 (Pacific Nurseries)
266076-01-7 (Sunol Christmas Tree Farm)
266076-02-5 (Sunol Tree Farm)
276095-01-5 (Sunol Valley Golf & Recreation)
266077-02-3 (Ura Farm)
264352-01-4 (Ura, John)
266075-01-9 (Valley Crest)
268276-01-1 (Valley Crest Nursery)
266093-01-2 (Valley Crest Tree Company)
268426-02-0 (Valley Crest Tree Company)
266075-02-7 (Valley Crest Tree Company)
266093-02-0 (Valley Crest Tree Company)
268276-02-9 (Valley Crest Tree Company)
266082-01-5 (Western Star Nursery)
266089-01-0 (Western Star Nursery)
267254-02-7 (Western Star Nursery)
266082-02-3 (Western Star)
266089-02-8 (Western Star)
267254-03-5 (Western Star)

(g) Raw water deliveries from Pilarcitos Reservoir and Crystal Springs Reservoir to Coastside County Water District as measured at the customer meters. These deliveries are considered positive for the purposes of Table 1. Currently, raw water deliveries to Coastside County Water District from both reservoirs are represented under account number 010027-01-9 contained in Form MGT441 prepared by the SFPUC's Customer Service Division:

(h) Crystal Springs Balancing Reservoir. The flow into or out of the Crystal Springs Balancing Reservoir shall be calculated based on the changes in the amounts of water stored in the reservoir. The amounts of water stored shall be determined by the use of water level sensors, and the application of water level readings to a water level-storage capacity table. Decreases in storage, which indicate a flow from the Balancing Reservoir into the system, shall be deemed positive in sign. Increases in storage, which indicate a flow into the Balancing Reservoir from the system, shall be deemed negative in sign. Over the period of a year, the total flows into and out of Crystal Springs Balancing Reservoir are nearly equivalent. As such, total system input from Crystal Springs Reservoir shall be deemed zero for calculating current base rates.

(i) Deliveries to Crystal Springs Reservoir as measured by the overflow weir at the Pulgas Pump Station. Deliveries from the system to Crystal Springs Reservoir ("spills") shall be deemed negative in sign for the purpose of determining "Base system input."

(j) Terminal Reservoirs. The "terminal reservoirs" consist of Sunset Reservoir, University Mound Reservoir, and Merced Manor Reservoir, each located within the City of San Francisco. The flow into or out of the terminal reservoirs shall be calculated based on the changes in the amounts of water stored in them. The amounts of water stored shall be determined by the use of water level sensors, and the application of water levels to water level-storage capacity tables. Over the period of a year, the total flows into and out of terminal reservoirs are nearly equivalent. As such, total system input from the terminal reservoirs shall be deemed zero for calculating base rates.

(k) Other Sources. Other sources of flow into, or from, the Regional Water System, shall be accounted for as "other sources." Examples of other sources of system input would include intertie water deliveries between the Regional System and the Santa Clara Valley Water District, and between the Regional System and the East Bay Municipal Utilities District, and deliveries of raw water from Crystal Springs Reservoir in the event of an emergency. Flows from the system shall be deemed negative in sign for the purpose of determining "Base system input."

(13) "Total base system input" shall equal the sum of the system inputs from the sources described in paragraph B.1.12.

(14) "Joint system loss reduction factor" shall equal "Total system base usage" divided by "Total base system input." "Joint system loss reduction factor" shall not exceed 1.0.

(15) "Daly City reduction factor" shall equal "Net San Francisco base deliveries" divided by "Gross San Francisco County line base deliveries." "Daly City reduction factor" shall not exceed 1.0.

(16) "Total suburban base deliveries" shall equal "Other suburban base deliveries" plus "Total wholesale base usage."

(17) "Suburban reduction factor" shall equal "Wholesale base usage" divided by "Total suburban base deliveries." "Suburban reduction factor" shall not exceed 1.0.

(18) "HHWPD Deliveries above Oakdale" shall equal the total amount of water delivered by the HHWPD to users located above the system input meters in Oakdale. Water users located above the system input meters in Oakdale are currently represented by Groveland Community Services District and the HHWPD facility at Moccasin.

(19) "HH Reduction Factor" is calculated for the purpose of determining the Wholesale Customers' share of the Hetch Hetchy Assessment. The factor shall equal a fraction, the numerator of which is the total system input measured at the Oakdale meters (Table 1, line 12.a) and the denominator of which is the sum of the total system input measured at the Oakdale meters (Table 1, line 12.a) plus the total "HHWPD deliveries above Oakdale" (Table 1, line 18).

SECTION C. DATA REQUIREMENTS AND SCHEDULE

1. Collection and Dissemination of Data

The SFPUC presently compiles daily flow data for the County-line meters, System Input and In-Line Meters, and daily reservoir water level data, and provides copies of that data to the Wholesale Customers (through BAWSCA) on a monthly basis. The SFPUC also provides copies of wholesale "Suburban Resale" and City Retail water usage data to BAWSCA on a monthly basis. Additionally, the SFPUC provides BAWSCA access to flow data for the meters as reported and recorded by the SFPUC's SCADA system.

The SFPUC shall continue to provide the flow and water usage data described above to BAWSCA on a monthly basis, and shall continue to allow BAWSCA access to the SCADA system data, so that a coordinated effort between the SFPUC and BAWSCA will allow for updating Table 1 of this Attachment annually on a timely basis.

It shall continue to be the SFPUC's responsibility to compile the data necessary to update Table 1 of this Attachment annually and the City shall deliver to BAWSCA, for review and approval, copies of the updated Table 1 by September 15 for the fiscal year ending the preceding June 30, as shown by the schedule contained in Section C.3.

Upon reasonable notice to the General Manager of the SFPUC, BAWSCA shall be given access to all water flow and usage records compiled by the SFPUC, including raw data, at reasonable times during business hours and shall have the right to copy such records and data at its expense.

2. Lack of Data

The parties recognize that, because of human error, mechanical failure, or other unplanned events, portions of the data required for the calculation of the usage rates and ratios described in Sections B and C of this Attachment occasionally may be unavailable or incorrect. In the event that such data are unavailable or inaccurate, the SFPUC shall make a reasonable estimate of the unavailable or incorrect data or use the most accurate alternative data that are available, and substitute the estimate therefor.

If the SFPUC uses an estimate of the unavailable or inaccurate data or alternative data, it shall provide BAWSCA with the following:

(1) a description of the unavailable or inaccurate data and the estimation or substitution of data used therefor;

(2) an explanation of the cause of the missing or inaccurate data and the reasons underlying the SFPUC's estimation or substitution of alternate data; and

(3) a statement of how the error or malfunction that caused the unavailability or inaccuracy of the data will be avoided in the future.

The SFPUC shall provide this information to BAWSCA upon calculation by the SFPUC of the usage rates and ratios described in this Attachment for the fiscal year in question.

3. <u>Schedule for Completing the Annual Calculations of Water Usage Rates</u>

The parties recognize the importance of updating Table 1 of this Attachment annually in a timely manner, and that historically, doing so has required a coordinated effort between the SFPUC and BAWSCA. To assure timely completion of the annual calculations of water usage rates and ratios, the parties agree to adhere to the following schedule.

(1) By August 15: The SFPUC shall forward to BAWSCA all data for the fiscal year ending the preceding June 30, necessary to make a determination of the base water usage and base allocation rates for the Wholesale Customers and the City.

(2) By September 15. The City shall deliver to BAWSCA, for review and approval, draft copies of the updated Table 1 for the fiscal year ending the preceding June 30.

(3) Between September 15 and October 15. The SFPUC and BAWSCA shall reconcile any discrepancies or inaccuracies in the draft calculations of water usage rates and shall reach agreement on a final updated Table 1 for the fiscal year ending the preceding June 30.

(4) By November 1. The SFPUC shall deliver to BAWSCA a finalized updated Table 1, signed by the SFPUC General Manager, or appropriate designee, representing the water usage rates agreed upon by the SFPUC and BAWSCA, for the fiscal year ended June 30.

(5) By November 15. BAWSCA shall return the finalized Table 1 to the SFPUC, counter-signed by the BAWSCA General Manager/CEO. If the SFPUC does not receive the countersigned Table 1 from BAWSCA by November 15, it may use the water use data as contained in the Table 1 delivered pursuant to paragraph (4) above, subject to arbitration as provided in section 8.01 of the Agreement.

SECTION D. COUNTY LINE AND IN-CITY TERMINAL RESERVOIR METER CALIBRATION AND MAINTENANCE

1. General

This section refers only to the County-Line and In-City Terminal Reservoir Meters. The term "meter(s)" includes the primary meter itself (most of the primary meters in the SFPUC's water system are Venturi-type flow meters) as well as any and all of the associated equipment used to measure, record, and transmit flow and water level data. The metering equipment associated with the primary metering device (also referred to as the secondary metering equipment) includes differential pressure transmitters, recorders, telecommunications equipment and the portion of the SFPUC's Supervisory Control and Data Acquisition (SCADA) System that is used to transmit flow and water level measurements from the water meter to the computer terminal that records the measured data.

The County-Line and In-City Terminal Reservoir meters, their general locations, and their associated metering equipment are listed in Table 4.

2. Frequency and Type of Work to be Performed

The meters, water level sensors, and associated metering equipment are to be inspected, tested, calibrated, and maintained according to the applicable meter calibration and maintenance frequency specified in Table 5.

3. Components of the Calibration and Maintenance Work

The SFPUC will contract with an independent metering consultant to perform periodic inspections, testing, servicing and calibrations of the meters and metering equipment for the County-line meters and In-City Terminal Reservoirs. The metering consultant's calibration and maintenance work will include the following components:

- Annual Pitot Tube Tests: Pitot tube flow tests shall be performed once a year on all Venturi-type flow meters. See Sections 4.b and 4.c for further detail.

- Quarterly Secondary Meter Equipment Testing and Calibration: The secondary metering equipment shall be tested for accuracy and calibrated quarterly at five input levels (0%, 25%, 50%, 75% and 100% of the full range of flow). See Section 4.a for further detail.

- Cleaning: Clean and remove dust, oils, dirt, etc. from all instruments.

- Flushing: Flush and clean Venturi tube differential pressure (D/P) sensing lines.

- Inspecting: Inspections for mechanical fatigue, leaky pipes and fittings, worn parts, and improper operation of electrical/electronic equipment.

- Lubrication: Mechanical parts shall be lubricated as needed.

4. Calibration Procedures

The metering consultant shall continue to calibrate and maintain the County-line meters and metering equipment listed in Table 4 in accordance with the frequency of work specified in Table 5. The work includes documenting meter readings and accuracy before and after calibration. Specific tasks to be completed by the metering consultant are as follows:

a) Quarterly testing and calibration. The secondary metering equipment shall be tested and calibrated quarterly using NIST Traceable test equipment, and a "dead weight tester."

The system loop error for the secondary metering equipment is determined by connecting its output to the differential pressure transmitter and adjusting the dead weight tester to 5 places over the full range of flow: 0%, 25%, 50%, 75% and 100%, while all instruments in the loop are connected. For water level transmitters, provide simulated test head equal to full range of the transmitter being calibrated, comparing the simulated test head to its 4-20 milliamp output signal to determine transmitter error and calibration requirements. The system loop error for the secondary metering equipment may not exceed +/-2%. The individual components of the secondary metering equipment shall also be tested at the same 5 input levels and calibrated as necessary to ensure the error of the system and individual components does not exceed +/- 2%.

b) Annual Pitot Tube Testing and Calibration. Annual Pitot tube testing shall be conducted for a comparison of flow totalized by the Pitot tube test equipment and the totalizer used by the SFPUC for water measurement and billing purposes. Annual Pitot tube flow testing shall be performed on all flow meters for assessment of Venturi error using the Annubar continuous flow method at 22% of the pipe radius. Pitot tube flow testing must be conducted continuously for a minimum of 30 minutes per test.

The Pitot tube flow tests are first performed before any of the secondary metering instruments are calibrated to determine the total system error (system consisting of the primary metering device and secondary metering equipment). Once the total system loop error has been established, perform secondary loop instrument testing and calibration as per the quarterly testing and calibration procedures described in 4.a above. If the total system error exceeds +/- 2% after calibration of the secondary metering equipment, minor adjustments to the differential pressure transmitter shall be made to correct (calibrate) the error in the Venturi meter. Repeat Pitot tube testing must be performed after the individual instrument calibration and differential pressure transmitter adjustments have been performed to establish that total system loop error is within +/- 2%.

c) Pitot tube testing shall be conducted at a flow rate representing the typical flow for the meter (and, if operationally possible, at three different flows ranging from a minimum to near maximum capacity flow).

d) The metering consultant shall perform the meter testing and calibration procedures utilizing the meter characteristic curves (for example, the pressure drop vs. flow for a Venturi meter) that have been obtained during previous meter calibration and maintenance work.

e) During each quarterly site visit, the metering consultant shall inspect, assess and document the condition of all metering equipment, including meter, gauges, indicators, recorders, transmitters and other instrumentation, used in the measurement and recording of flow rates and cumulative flow totals and shall document all operational problems with the calibration instruments and meters during the calibration process. Problems may include air entrainment, leakage, flow disturbance and unstable meter readings.

f) Prior to each quarterly site visit, the metering consultant shall review prior calibration records and reports for each meter to determine if previously-identified errors or equipment deficiencies were corrected as previously recommended.

g) Each quarter, the metering consultant shall submit a final report (See Section 6) containing all of the calibration results for each meter tested and calibrated during the quarter. The metering consultant's report shall include a narrative description of the work conducted on each meter and meter calibration reports for the individual metering equipment. The quarterly report shall also address deficiencies that were not previously corrected according to the recommendations made in the prior report.

5. Calibration Instruments

The instrument used for flow testing of the primary meter (Venturi) must meet the accuracy standards required by the American Water Works Association (AWWA), and be capable of measuring actual flows with an error of less than +/- 2%. If a particular calibration instrument is not rated for accuracy by the AWWA, its accuracy will be determined by reference to its manufacturer's representations as to accuracy.

6. Calibration Reports

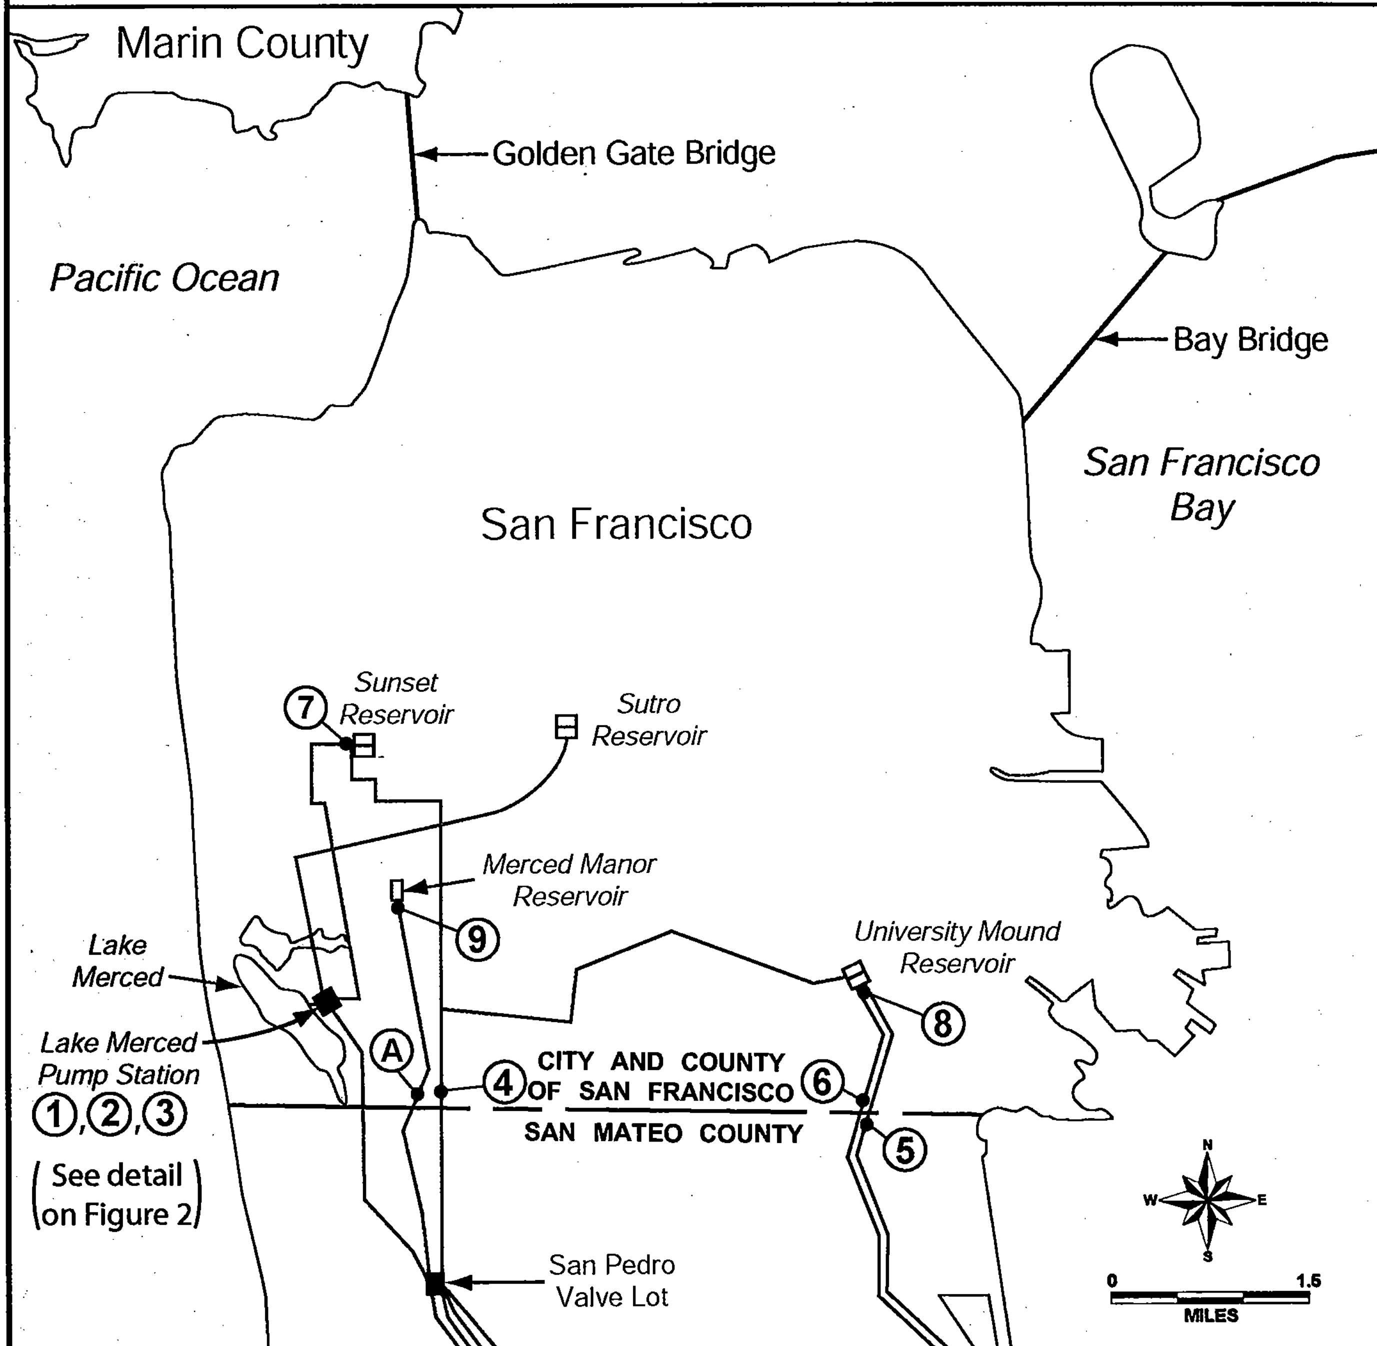
Within fourteen (14) working days after the beginning of each quarter, the metering consultant shall submit a written progress report of the work performed during the previous quarter. Each quarterly report will describe the results of the meter calibrations and any other tasks performed. The report will also include comments regarding any observations of abnormal conditions and any recommendations regarding these meters and their related equipment.

The reports must include complete descriptions and status of meters and related equipment, dates and times of service, all calibration specifics, pipeline dimensions, range of flow rates and totalized volumes, before and after error analysis and accuracy levels achieved, testing equipment used, and the name(s) of the person(s) that performed the work.

When appropriate and necessary, the metering consultant shall provide recommendations for improving the accuracy and reliability of the equipment and/or the methods of data collection. If, in the opinion of the metering consultant, the condition of a meter or its associated metering equipment is found to be defective, damaged, or otherwise in need of immediate repair or replacement, the metering consultant shall: 1) promptly notify the appropriate SFPUC personnel of the problem and recommend a solution to the problem so that the SFPUC can determine how to address it and, 2) include the problem description in its quarterly report.

FIGURE 1

Locations of SFPUC County-Line Meters and In-City Terminal Reservoirs



METER	PIPELINE	LOCATION
1	Sunset	Lake Merced Pump Station
2	Sutro	Lake Merced Pump Station
3	Lake Merced Outfall	Lake Merced Pump Station
4	San Andreas No. 2	Junipero Serra (Hwy. 280) South of Belle Ave.
5	Crystal Springs No. 1	PG&E Martin Service Center Yard
6	Crystal Springs No. 2	Tamasco Ct. South of Sunnydale Ave.
A	San Andreas No. 3 (Planned)	To be determined

METER	RESERVOIR	LOCATION
7	Sunset Reservoir	26th Avenue and Ortega
8	University Mound Reservoir	University Avenue and Bacon
9	Merced Manor Reservoir	23rd Avenue and Ocean

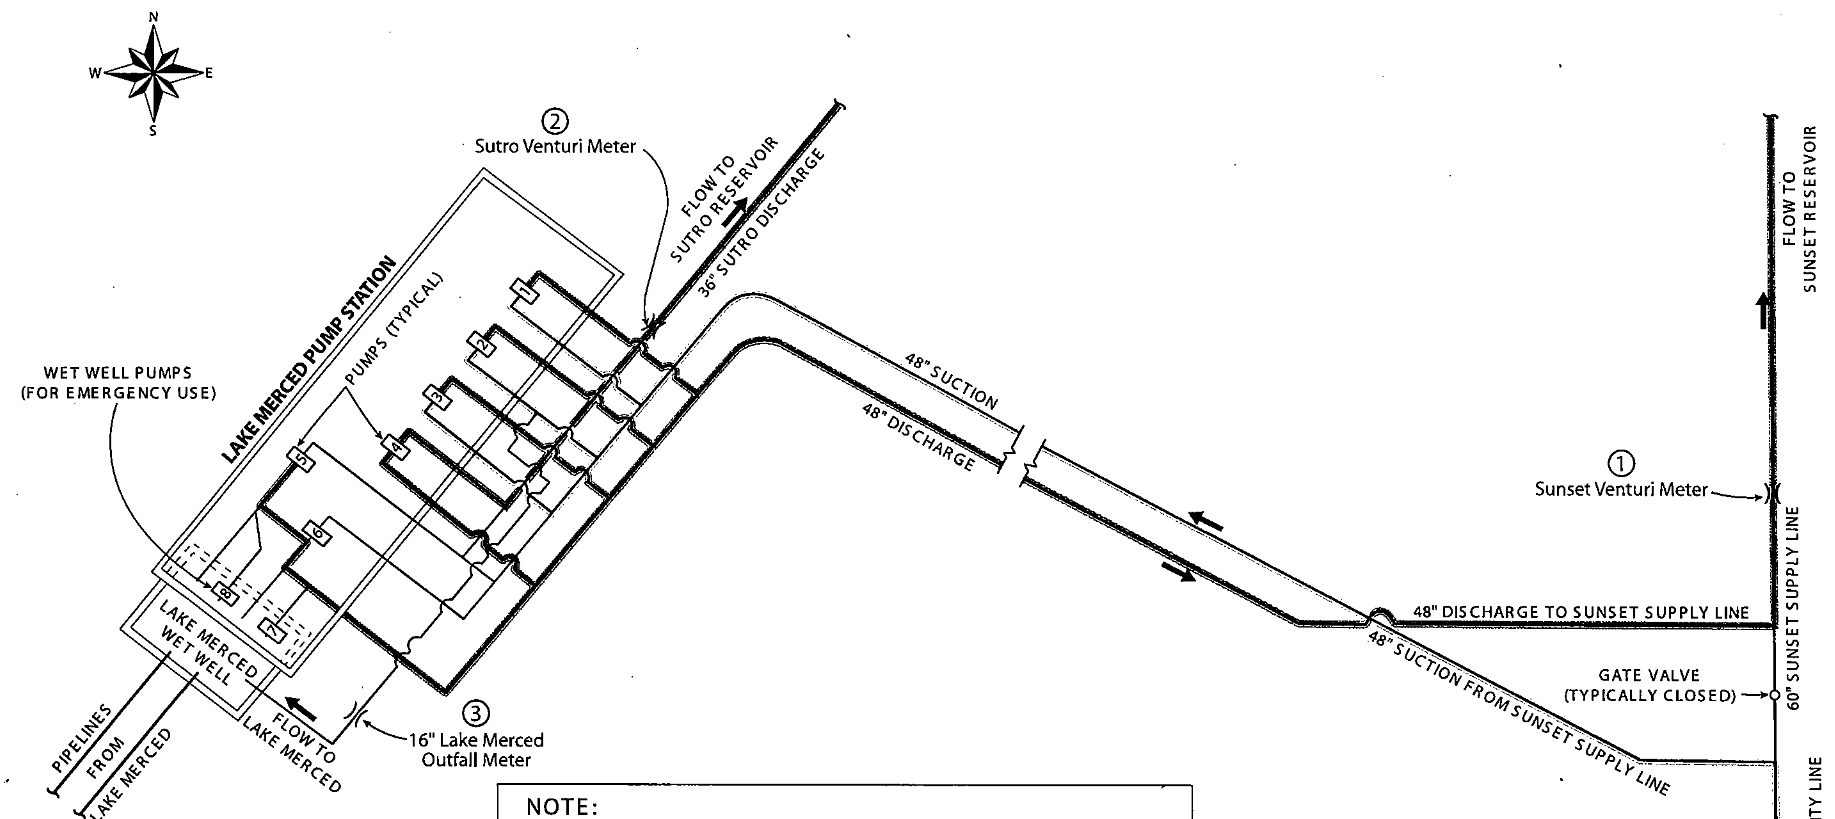
JobFolder/2175/Figure 2(122308)draft.ai



NOTE:
Water enters Lake Merced Pump Station from the Sunset supply line (pipeline highlighted in yellow) and is discharged from the Sunset Pumps (numbered 1, 2, and 3) to Sunset Reservoir located in San Francisco, or to the suction side of the Sutro Pumps (numbered 4, 5, and 6). Sutro Pump Nos. 5 and 6 are typically on standby. Sutro Pump No. 4 delivers water from the pump station to Sutro Reservoir located in San Francisco. Deliveries from the SFPUC water system to Lake Merced are accomplished by gravity through the 16-inch pipeline that connects to the suction side of Sunset Pump No. 2.

Generalized Schematic of Lake Merced Pump Station

TABLE 4
SFPUC COUNTY-LINE METERS, IN-CITY TERMINAL RESERVOIRS, AND ASSOCIATED METERING EQUIPMENT

County-Line Meter	Meter Type	Location
1. **Sunset**	60" Venturi	Lake Merced Pump Station
Associated Metering Equipment:	• Rosemount D/P transmitter • Honeywell recorder • SCADA	
2. **Sutro**	36" Venturi	Lake Merced Pump Station
Associated Metering Equipment:	• Rosemount D/P transmitter • Honeywell recorder • SCADA	
3. **Lake Merced Outfall**	16" Mag. Meter	Lake Merced Pump Station
Associated Metering Equipment:	• Honeywell recorder • SCADA	
4. **San Andreas No. 2**	36" Venturi	Junipero Serra (Hwy. 280) south of Belle Avenue
Associated Metering Equipment:	• Yokogawa D/P transmitter • NLS display • AGM electronics • Honeywell recorder • SCADA	
5. **Crystal Springs No. 1**	44" Venturi	PG&E Martin Service Center Yard
Associated Metering Equipment:	• Yokogawa D/P transmitter • NLS display • AGM electronics • Honeywell recorder • SCADA	
6. **Crystal Springs No. 2**	60" Venturi	Tamasco Ct. south of Sunnydale Avenue
Associated Metering Equipment:	• Yokogawa D/P transmitter • NLS display • AGM electronics • SCADA	
In-City Terminal Reservoirs		
1. **Sunset**	Pressure Transducer	26th Avenue and Ortega
Associated Metering Equipment:	• Honeywell recorder • SCADA	
2. **Merced-Manor**	Pressure Transducer	23rd Avenue and Ocean
Associated Metering Equipment:	• Honeywell recorder • SCADA	
3. **University Mound**	Pressure Transducer	University Avenue and Bacon
Associated Metering Equipment:	• Honeywell recorder • SCADA	

TABLE 5
METER CALIBRATION AND MAINTENANCE FREQUENCY

METER/ EQUIPMENT	FREQUENCY			WORK TO BE PERFORMED (See Work Codes Listed Below)					
	Quarterly	Semi-Annual	Annual	CA	CL	FL	IN	LU	PT
Venturi Meters			X	X		X (1)	X (1)		X
Magnetic Meters		X		X (2)	X (2)		X (2)		
Yokagowa D/P Transmitters	X			X	X	X	X		
Rosemount D/P Transmitters	X			X	X	X	X		
Honeywell Recorders	X			X	X		X		
Water Level Sensors (Pressure Transducers)	X			X	X		X		
SCADA Electronics	X			X					
AGM Electronics	X			X					
NLS Digital Displays	X			X					
Electrostatic 24V DC Power Supplies			X				X (3)		
ASCO Solenoids			X		X		X (4)	X	

WORK CODES:
CA = CALIBRATE; CL = CLEAN; FL = FLUSH; IN = INSPECT; LU = LUBRICATE; PT = PITOT TUBE TEST.

NOTES:
(1) Inspection and flushing requirements for Venturi meters refer to the pressure tubing from the meter to the differential pressure transmitter.
(2) May calibrate using clamp-on meter where conditions allow. Inspection and cleaning requirements for magnetic meters refer to the sensors or probes that are inserted through the pipe wall.
(3) Adjust voltage if necessary.
(4) Replace rubber ware as needed.

Notes
1. 6/30/08 CWIP per FAMIS
2. FY 2008-09 Expenditures posted through 3/20/09 per FAMIS
3. Wholesale share of CWIP 70.1% (see Note 5 Attachment K-1)
4. Water Related HHWP CWIP includes 100% of Water and 45% of Joint
5. Wholesale share of CWIP 64.2% (see Note 5 Attachment K-1)
6. Fund 2A expenditures are funded by Series 2006A bond proceeds, proceeds of commercial paper redeemed from 2006A proceeds and earnings on such proceeds, as applicable.

$110,065,000
PUBLIC UTILITIES COMMISSION
OF THE CITY AND COUNTY OF SAN FRANCISCO
SAN FRANCISCO WATER REVENUE BONDS, 2006 REFUNDING SERIES B

CERTIFICATE REGARDING USE OF PROCEEDS

The undersigned hereby states and certifies as follows:

(i) The undersigned is the General Manager of the Public Utilities Commission of the City and County of San Francisco (the "Commission"), and is authorized to execute this certificate on behalf of the Commission and is knowledgeable with respect to the matters set forth herein.

(ii) On the date hereof, the Commission is issuing the two series of bonds captioned above (the "2006 Series A Bonds," the "2006 Refunding Series B Bonds" and, together, the "Bonds") pursuant to an Amended and Restated Indenture dated as of August 1, 2002 and the First Supplemental Indenture dated as of March 1, 2006 (collectively, the "Indenture"), both by and between the Commission and U.S. Bank National Association, as trustee (the "Trustee").

(iii) The Trustee will transfer and deposit the proceeds of the 2006 Series A Bonds received by the Trustee on the date hereof as follows:

(1) $48,212,528.32 will be deposited in the 2006 Series A Capitalized Interest Account established within the Interest Fund;

(2) $15,958,031.25 will be deposited in the 2006 Series A Reserve Account of the Bond Reserve Fund;

(3) $623,906.09 will be deposited in the 2006 Series A Costs of Issuance Fund;

(4) $120,622,352.19 will be deposited in the 2006 Series A Refunding Fund and transferred pursuant to Irrevocable Refunding Instructions of the Commission dated the date hereof; and

(5) the remaining $338,600,816.86 will be transferred to the Treasurer for deposit to the 2006 Series A Project Fund.

(iv) The proceeds of the 2006 Series A Bonds transferred pursuant to the Irrevocable Refunding Instructions of the Commission will be used to defease and refund the Commission's Commercial Paper Notes (Water Series) on a current basis. The Notes were issued to finance a portion of the facilities described in Exhibit A hereto.

(v) The proceeds of the Bonds deposited in the 2006 Series A Project Fund will be used to finance a portion of the facilities described in Exhibit A hereto.

(vi) The Trustee will transfer and deposit the proceeds of the 2006 Refunding Series B Bonds received by the Trustee on the date hereof as follows:

(1) $192,498.04 will be deposited in the 2006 Refunding Series B Costs of Issuance Fund; and

(2) $111,178,241.95 will be deposited in the 2006 Refunding Series B Refunding Fund.

(vii) The proceeds of the Bonds deposited in the 2006 Refunding Series B Refunding Fund, together with amounts on deposit in the funds and accounts established under the Indenture for the Commission's San Francisco Water Revenue Bonds, 1996 Series A (the "1996 Series A Bonds") and its San Francisco Water Revenue Bonds, 2001 Series A (the "2001 Series A Bonds"), will be used to refund on an advance basis a portion of the outstanding 1996 Series A Bonds and a portion of the outstanding 2001 Series A Bonds. The portion of the 1996 Series A Bonds being refunded were issued to finance the facilities (the "1996 Project") described in Exhibit B hereto, and the portion of the 2001 Series A Bonds being refunded were used to finance the facilities (the "2001 Project") described in Exhibit B hereto.

(viii) Exhibit C hereto attached describes (A) each use to be made by any person of the Project, the 1996 Project and the 2001 Project other than use by the Commission and other non-federal governmental units and other than use by members of the public generally, and (B) payments (if any) directly or indirectly in respect of such use which are to be made after the date hereof;

(ix) Other than as set forth in Exhibit A and Exhibit B, no portion of the proceeds of the Bonds will be used, directly or indirectly, to make or finance a loan to any person (other than a State or local government unit) or to acquire property which will be sold or leased to any person (other than a State or local government unit) on an installment a sale basis except as referenced in Exhibit C.

(x) The Commission expects to use the Project for the purposes referenced and discussed in Exhibit A, Exhibit B, Exhibit C and Exhibit D or for other governmental purposes of the Commission during the entire term of the Bonds.

(xi) Set forth on Exhibit D is the Commission's methodology for determining governmental use and private use with respect to the water enterprise.

(xii) To the best knowledge of the undersigned, the above statements are reasonable and there are no other facts, estimates or circumstances, other than those set forth herein, that would materially affect the statements made herein.

Capitalized terms used but not defined herein have the meanings set forth in the Indenture.

IN WITNESS WHEREOF, I have hereunto set my name this 15th day of March, 2006.

PUBLIC UTILITIES COMMISSION OF THE
CITY AND COUNTY OF SAN FRANCISCO

This certificate is for illustration only. It was prepared in 2006 and shown groundwater and recycled water projects as regional instead of local. In addition, it does not reflect expenditures for the portions of regional assets which in rate base as of June 30, 2008 nor what is expected to be added to rate base through June 30, 2009. For these reasons, the percentages shown for regional and local projects are not accurate.

REVENUE FUNDED CAPITAL
ANNUAL REPORTING REQUIREMENTS
(Section 5.04B)

Part A. Updated Actual Information Through Most Recent Fiscal Year (Due in November)

Each year, the SFPUC will provide a report on the status of the regional revenue funded projects with the following information:

Project-level information (through close-out)

1 Scope of project
2 Current cost estimate/budget.
3 Expected milestone dates (ie, design, environmental, construction period, close-out, etc.)
4 Contract status
5 Reasons for status changes from prior report.
6 Other information relevant to whether project is on time/on budget.
7 For most recently completed fiscal year and estimated for current year:
8 Total expenditures (capital and operating); amounts paid from other sources.
9 Amount of encumbered and unencumbered appropriations
10 Application of any unused appropriations

Wholesale Capital Fund

11 Beginning balance, deposits, capital expenditures (by project), earnings, ending balance.
12 Components of ending balance; wholesale portion of:
13 Appropriated and encumbered
14 Appropriated but unencumbered

Part B. Proposed Appropriations for Upcoming Year (Due in March)

15 Project information, to the extent not provided in Part A
16 Expected funding needs for regional projects
17 Unused or excess appropropriations carried over.
18 Proposed appropriation for upcoming fiscal year.

D. Wholesale Revenue Requirement for Fiscal Year			$140,994,733
E. Settlement Credits or Other Adjustments			$21,000
F. 1984 Agreement Balancing Account Credits			$1,997,220
G. Balancing Account as of June 30, 2010			$15,527,053
H. Net Change in Wholesale Revenue Coverage			$4,488,233
I. Total Revenue Deficiency or Surplus			$20,015,286
J. Projected Water Sales in Ccf	84,621,240	83,205,600	85,920,000
K. Deficiency or (Surplus) $/Ccf			$0.23
L. Deficiency or (Surplus) Ccf as a Percentage of Revenues			15.7%

Note: Dollar amounts are for illustrative purposes only. The Parties have not agreed on the amount of the balancing account as of June 30, 2007, revenue requirement for FY 2007-08, settlement credits for FY 2007-08, and the amount of the balancing account as of June 30, 2009.

BALANCING ACCOUNT / RATE SETTING CALCULATION
METHOD OF CALCULATION
REFERENCE SECTION 6.03.A.3.a

N = The year for which rates are being set

N-1 = The current year

N-2 = The most recently completed year for which actual results are available

Calculation Method:

Step 1 Determine the actual revenue differential for year N-2
- A. Enter the beginning amount of the Balancing Account
- B. Calculate the interest earned at the Pooled Investment Account Rate for (A)
- C. Enter the actual Wholesale revenues billed
- D. Enter the Wholesale Revenue Requirement
- E. Enter settlement credits or adjustments, if any
- F. Enter carry-over 1984 Agreement credits owed the City, if any
- G. Calculate the ending amount of the Balancing Account

Step 2 Determine the projected revenue differential for year N-1
- A. Enter the beginning amount of the Balancing Account; this is the same amount as G in Step 1
- B. Calculate the interest earned at the Pooled Investment Account Rate for (A)
- C. Enter the actual Wholesale revenues billed
- D. Enter the Wholesale Revenue Requirement
- E. Enter settlement credits or adjustments, if any
- F. Enter carry-over 1984 Agreement credits owed the City, if any
- G. Calculate the ending amount of the Balancing Account

Step 3 Determine the projected revenue differential for year N
- A. Enter the beginning amount of the Balancing Account; this is the same amount as G in Step 2
- B. Calculate the interest earned at the Pooled Investment Account Rate for (A)
- C. Enter the actual Wholesale revenues billed
- D. Enter the Wholesale Revenue Requirement
- E. Enter settlement credits or adjustments, if any
- F. Enter carry-over 1984 Agreement credits owed the City, if any
- G. Calculate the ending amount of the Balancing Account
- H. Enter the net change in the Wholesale Revenue Coverage, if applicable
- I. Calculate the total revenue deficiency or surplus (G) + (H)
- J. Enter the projected water sales to Wholesale Customers in Ccf
- K. Calculate the required increase in the commodity portion of the rate by dividing (I) by (J)
- L. Calculate the required increase in revenues by dividing (I) by (C)

REPRESENTATION LETTER

Certification Pursuant to Water Sales Agreement (the Agreement) between the City and County of San Francisco (San Francisco) and certain wholesale customers in the counties of San Mateo, Santa Clara, and Alameda (the Wholesale Customers) effective July 1, 2009.

Each of the undersigned certifies that:

1. I have reviewed San Francisco Water Department and Hetch Hetchy Water & Power Department Report on the Calculation of the Wholesale Revenue Requirement and Statement of Changes in the Balancing Account (the Statement) for the year ended June 30, 200X;

Based on my knowledge, this report and Statement do not contain any untrue statements of a material fact or omit to state a material fact necessary to make the statements made, in light of the circumstances under which such statements were made, not misleading with respect to the period covered by the report;

Based on my knowledge, the Statement and other financial information included in the report, fairly presents in all material respects the proper costs incurred and allocated to the Wholesale Customers in accordance with the provisions of the Agreement.

The below certifying officers and I are responsible for establishing and maintaining internal control over financial reporting and have:

Designed such internal control over financial reporting, or caused such internal control over financial reporting to be designed under our supervision, to provide reasonable assurance regarding the reliability of financial reporting for purposes of the preparation of the Statement.

Evaluated the effectiveness of the allocation procedures to ensure compliance with the terms of the Agreement.

The Statement fully complies with the contractual requirements of the Agreement and fairly presents, in all material respects, the allocation of costs to the Wholesale Customers in accordance with the Agreement.

March 31, 2011

Nicole Sandkulla
Senior Water Resources Engineer
Bay Area Water Supply and Conservation Agency
155 Bovet Road, Suite 302
San Mateo, CA 94402

Dear Nicole,

Attached please find additional information through 2035 on the Regional Water System's supply reliability for use in the Wholesale Customer's 2010 Urban Water Management Plan updates. The SFPUC has assessed the water supply reliability under the following planning scenarios:

- Projected Single dry-year supply for 2010
- Projected Multiple dry-year supply beginning 2010; and
- Projected supply reliability for years 2010-2035.

Table 1 summarizes deliveries to the Wholesale Customers for projected single dry-year supply for 2010 and projected multiple dry-year supply beginning 2010.

With regards to future demands, the SFPUC proposes to expand their water supply portfolio by increasing the types of water supply resources. Table 2 summarizes the water supply resources assumed to be available by 2035.

Concerning allocation of supply during dry years, the Water Shortage Allocation Plan ("Plan") was utilized to allocate shortages between the SFPUC and the Wholesale Customers collectively. The Plan implements a method for allocating water among the individual Wholesale Customers which has been adopted by the Wholesale Customers. The Plan was adopted pursuant to Section 7.03(a) of the 1984 Settlement Agreement and Master Water Sales Contract and has been updated to correspond to the terminology used in the June 2009 Water Supply Agreement between the City and County of San Francisco and Wholesale Customers in Alameda County, San Mateo County and Santa Clara County.

Finally, the SFPUC estimated the frequency and severity of anticipated shortages for the period 2010 though 2035. For this analysis, we assumed that the historical hydrologic period is indicative of future events and evaluated the supply reliability assuming a repeat of the actual historic hydrologic period 1920 through 2002. The results of this analysis are summarized in Table 3.

It is our understanding that you will pass this information on to the Wholesale Customers. If you have any questions or need additional information, please do not hesitate to contact me at (415) 554-0792.

Sincerely,

Paula Kehoe

Paula Kehoe
Director of Water Resources

Notes: **Bold and highlighted indicates unacceptable LOS.**

LOS=Level of Service. Delay=average control delay per vehicle.

*Indicates LOS based on unserved demand. At these locations, upstream & downstream congestion results in delay not captured by VISTRO analysis.

**Indicates planned signal. (Stop-sign controlled under Existing Conditions).
